MoMaF: Science Data Center for Molecular Material Research

The long-term preservation and reuse of research data are not systematically organized in scientific disciplines ranging from molecular chemistry to materials science, and solutions of the individual research groups lead to a low availability and visibility of research results.

So far, there is a lack of an urgently needed national and international institution to play the leading role by bundling competencies in research data storage, processing, curation, AI-supported analysis, and interdisciplinary reuse for the research fields between molecular chemistry and materials.

Presenter: SELZER, M.
