

On the direct correlation between γ -rays and neutrinos from blazars

Shan Gao

Collaborators: Martin Pohl, Walter Winter

arXiv: 1610.05306

Dec. 9, 2016
HAP workshop,
Cochem, Germany

Outline

- Motivation

Why blazars / MWL & Multi-Msg. / $L_v \sim L_\gamma$?

- Methods and modeling

What's special on PKS B1424-418 / our analysis ?

- Results and implications

What's new to consider in a future analysis ?

Blazars

Figure: blazar, Urry & Padovani 95

- Relativistic jets & Doppler boosting;
- Power from SMBH
- Spectrum: non-thermal double hump
- Variable on all time scales
- Population: 745 (3LAC catalog)
- Distribution: isotropic
- Luminosity range $\sim 10^{44-49}$ erg/s.
- Jet Component: unknown - leptonic, hadronic, magnetic, ...

FSRQ, LBL
e.g. PKS B1424-418

HBL
e.g. Mrk 421

Ghisellini, 2016
blazar sequence 2.0

neutrino production

Dissipation in the jet

Proton acceleration (Diffusive shock acc., stochastic acc., mag. reconn. ...)

see talks by [Asano](#), [Nalewajko](#)

Interacting with a target photon or another proton

γ -rays and neutrinos

They have comparable energy budgets

Blazars significantly contribute to EGRB*

promising candidate as IceCube neutrino source

*Ajello et al. Astrophys.JL 2015

IceCube analysis 2LAC blazars

IceCube collaboration, arXiv: 1611.03874

All 2LAC blazars (862 objects, FSRQ, LBL, IBL, HBL)

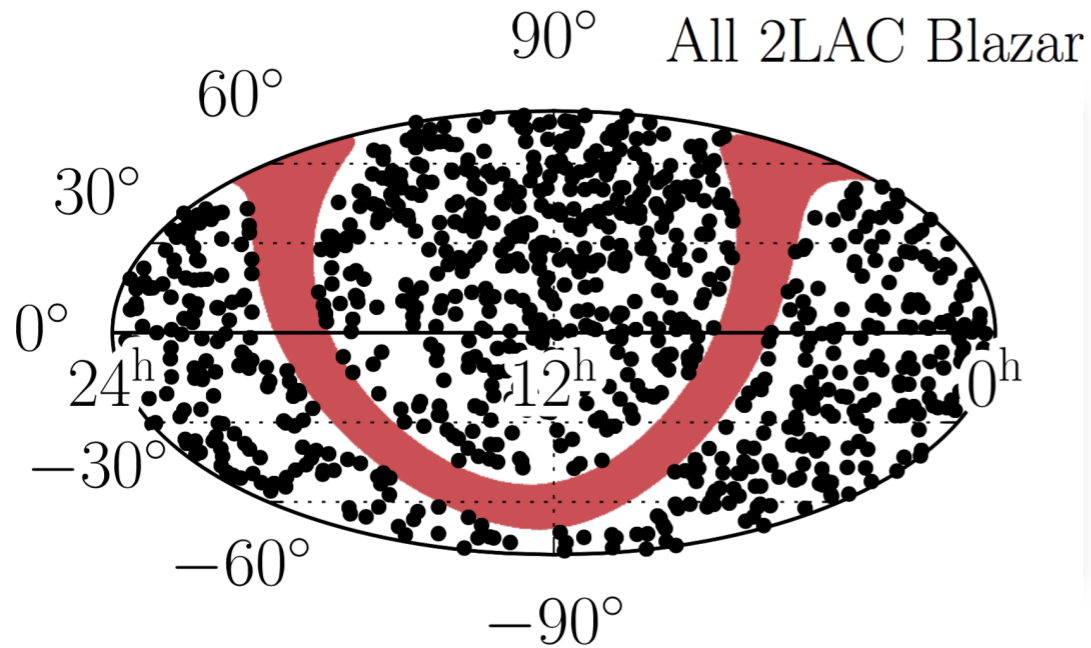

equal weighting

γ -weighting

γ -weighting: $L_\nu = L_\gamma$ for each source

equal weighting: dN/dS follows the same as γ -rays; No correlation for individual source

IceCube analysis 2LAC blazars

IceCube collaboration, arXiv: 1611.03874

All 2LAC blazars (862 objects, FSRQ, LBL, IBL, HBL)

$L_\nu \sim L_\gamma$ relation is crucial for any kind of analysis

γ -weighting: $L_\nu = L_\gamma$ for each source

equal weighting: dN/dS follows the same as γ -rays; No correlation for individual source

On theory side: why MWL & Multi-Msg. ?

One central issue: tension between
No. of para. & No. of data points

On theory side: why MWL & Multi-Msg. ?

One central issue: tension between
No. of para. & No. of data points

	Group	Symbol	Definition
Parameters	Global	R'_{blob}	Comoving radius of blob, fixed to 7.5×10^{17} cm
		f_{esc}	e^{\pm} and p escape fraction, fixed to 1/10
		Γ_{bulk}	bulk Lorentz factor of the blob fixed to 35
	Leptonic	B'	Magnetic field strength, blob frame
		$L_{e,\text{inj}}$	Injection luminosity of primary e^- , AGN frame
		$\gamma'_{e,\text{min}}$	Minimum Lorentz factor of primary e^- , blob frame
		$\gamma'_{e,\text{max}}$	Maximum Lorentz factor of primary e^- , blob frame
	Hadronic	$\alpha'_{e,\text{idx}}$	Power law index of injected primary e^-
		$\alpha'_{p,\text{idx}}$	Power law index of injected protons, fixed to -2.0
		η_{b}	Luminosity ratio p to e^- at injection, <i>i.e.</i> , $\eta_{\text{b}} \equiv L_{p,\text{inj}}/L_{e,\text{inj}}$
		$E_{p,\text{max}}^{\text{ob}}$	Maximal energy of injected protons, observer frame

big blazar parameter table for the simplist hadronic model :
one-zone + single power-law injections

PKS B1424 418

$z=1.522$ FSRQ

SG,Pohl,Winter arxiv:1610.05306

Kadler et al. NatPhys 2016

- Positional and temporal correlation with “big-bird” event (IC35, 2PeV)
- Sufficient energy in γ -rays \rightarrow if all converted to ν \rightarrow multiple events
- Low background coincidence probability

for PKS B1424 418

	1st peak (eV-keV)	middle range	2nd peak (MeV-TeV)	Example
Pure Leptonic	L primary e-syn	L Synchrotron-Self Compton (SSC)	L SSC or External-IC	can explain most blazars
LH-SSC	L primary e-syn	H secondary lep emission	L SSC	PKS B1424-418
LHπ	L primary e-syn	H secondary lep emission	H π^0 decay or secondary lep	Mrk 421
LHs	L primary e-syn	H secondary lep emission	H proton syn	3C 279
Pure Hadronic	H proton-syn	H secondary lep emission	H π^0 decay or secondary lep	postulated

for PKS B1424 418

	1st peak (eV-keV)	middle range	2nd peak (MeV-TeV)	Example
Pure Leptonic	L primary e-syn	L Synchrotron-Self Compton (SSC)	L SSC or External-IC	can explain most blazars
LH-SSC	L primary e-syn	H secondary lep emission	L SSC	PKS B1424-418
LHπ	L primary e-syn	H secondary lep emission	H π^0 decay or secondary lep	Mrk 421
LHs	L primary e-syn	H secondary lep emission	H proton syn	3C 279
Pure Hadronic	H proton-syn	H secondary lep emission	H π^0 decay or secondary lep	postulated

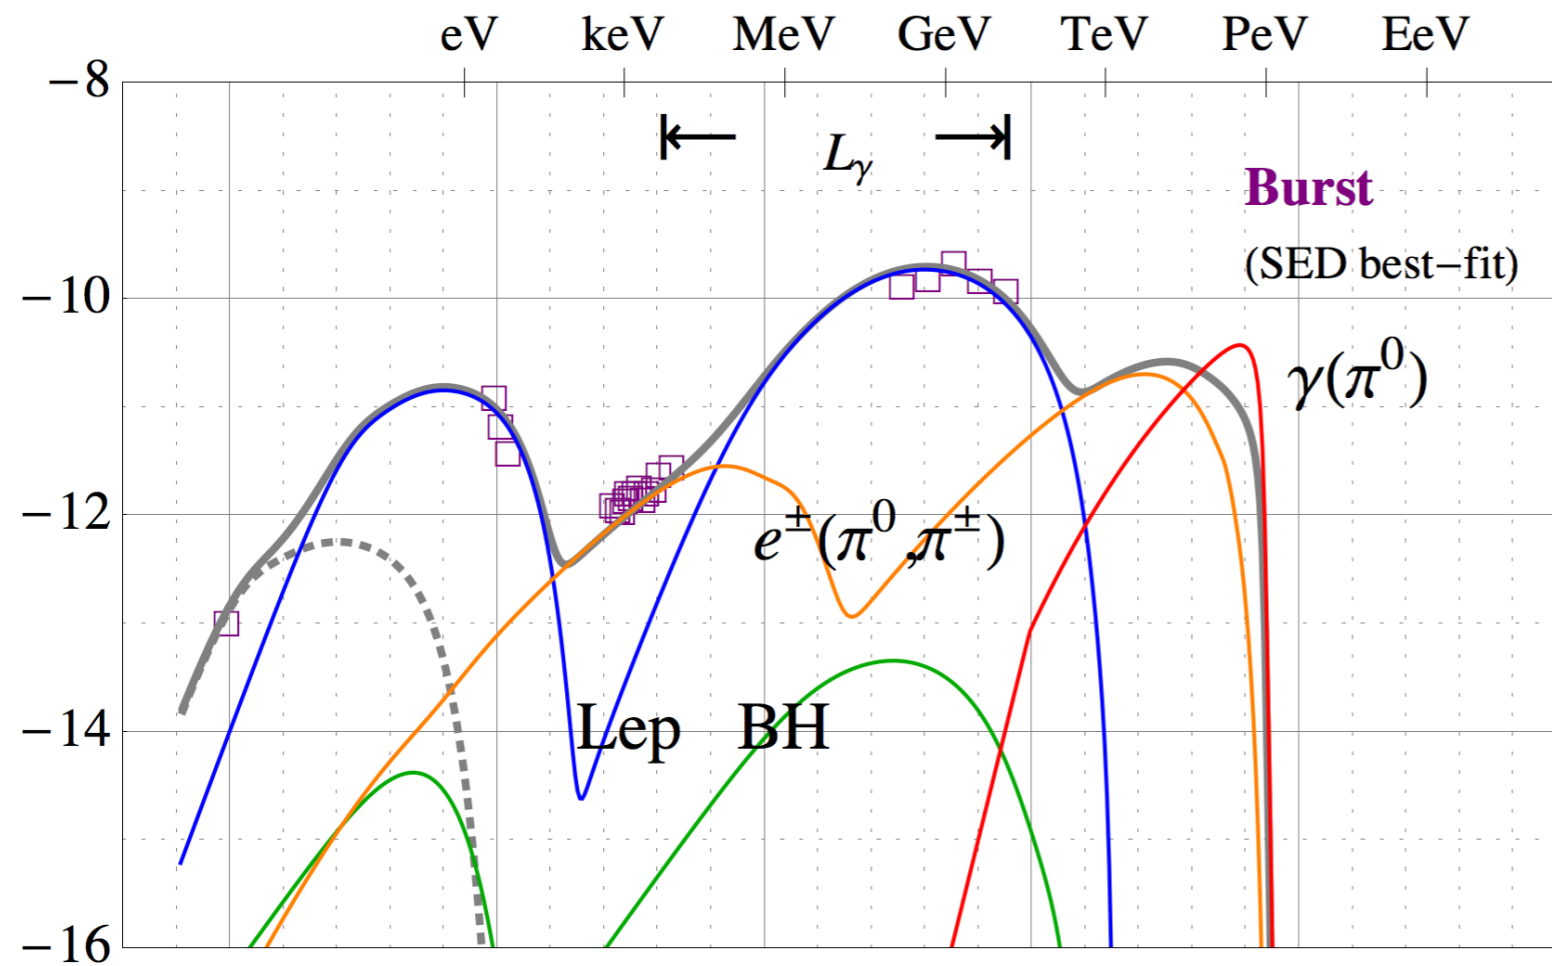

Analytical calculation: E_{peak} , L_{peak} , E_v must be consistent with observation;
BH, p_{syn} not overshooting SED, etc.

for PKS B1424 418

	1st peak (eV-keV)	middle range	2nd peak (MeV-TeV)	Example	
Pure Leptonic	L primary e-syn	L Synchrotron-Self Compton (SSC)	L SSC or External-IC	can explain most blazars	✓
LH-SSC	L primary e-syn	H secondary lep emission	L SSC	PKS B1424-418	✓
LHπ	L primary e-syn	H secondary lep emission	H π^0 decay or secondary lep	Mrk 421	✗
LHs	L primary e-syn	H secondary lep emission	H proton syn	3C 279	✗
Pure Hadronic	H proton-syn	H secondary lep emission	H π^0 decay or secondary lep	postulated	✗

Analytical calculation: E_{peak} , L_{peak} , E_v must be consistent with observation;
BH, p_{syn} not overshooting SED, etc.

Components of the SED

Hadronic X-rays

SG,Pohl,Winter arxiv:1610.05306

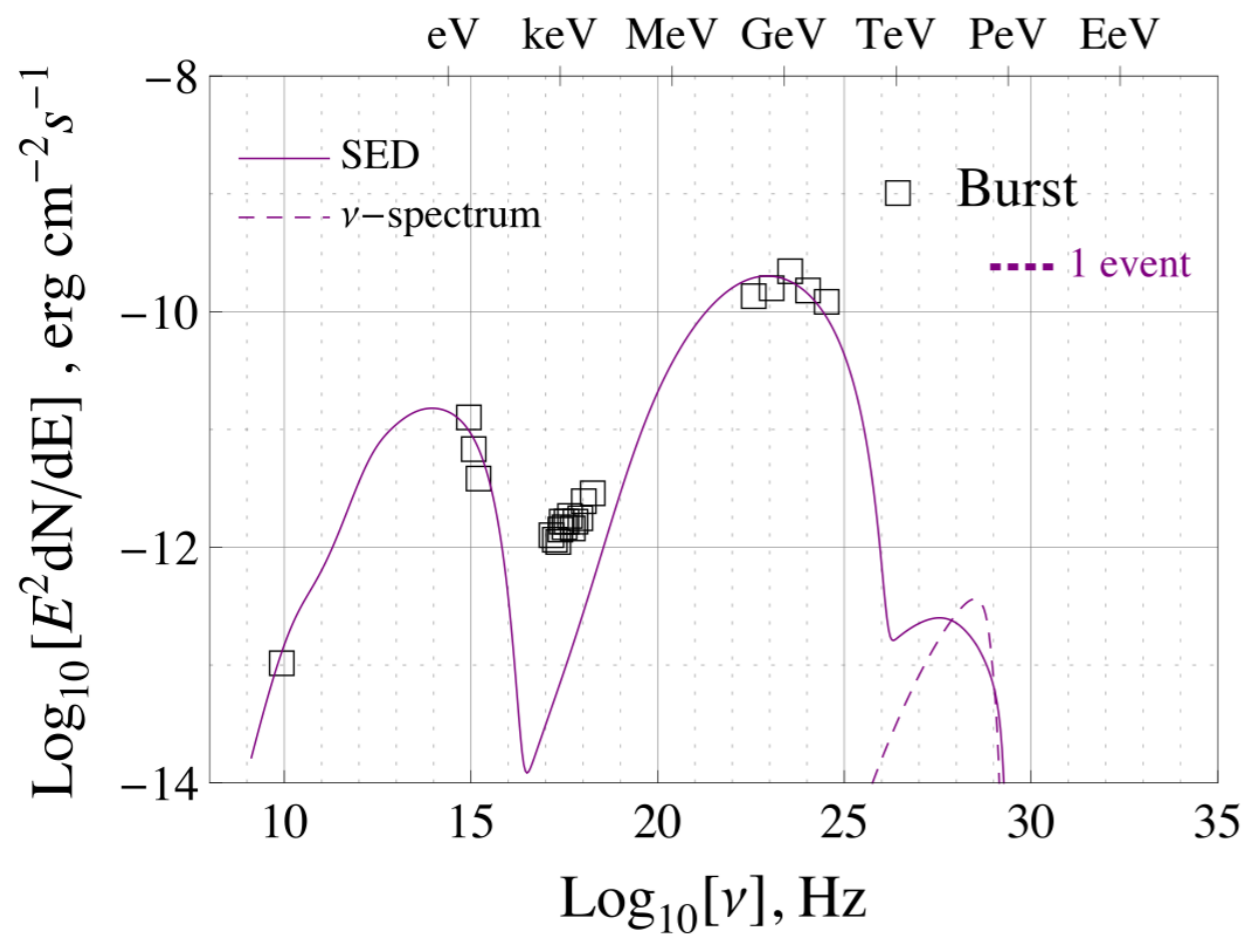

Suggesting $L_{\nu} \neq L_{\gamma}$

parameter space scan

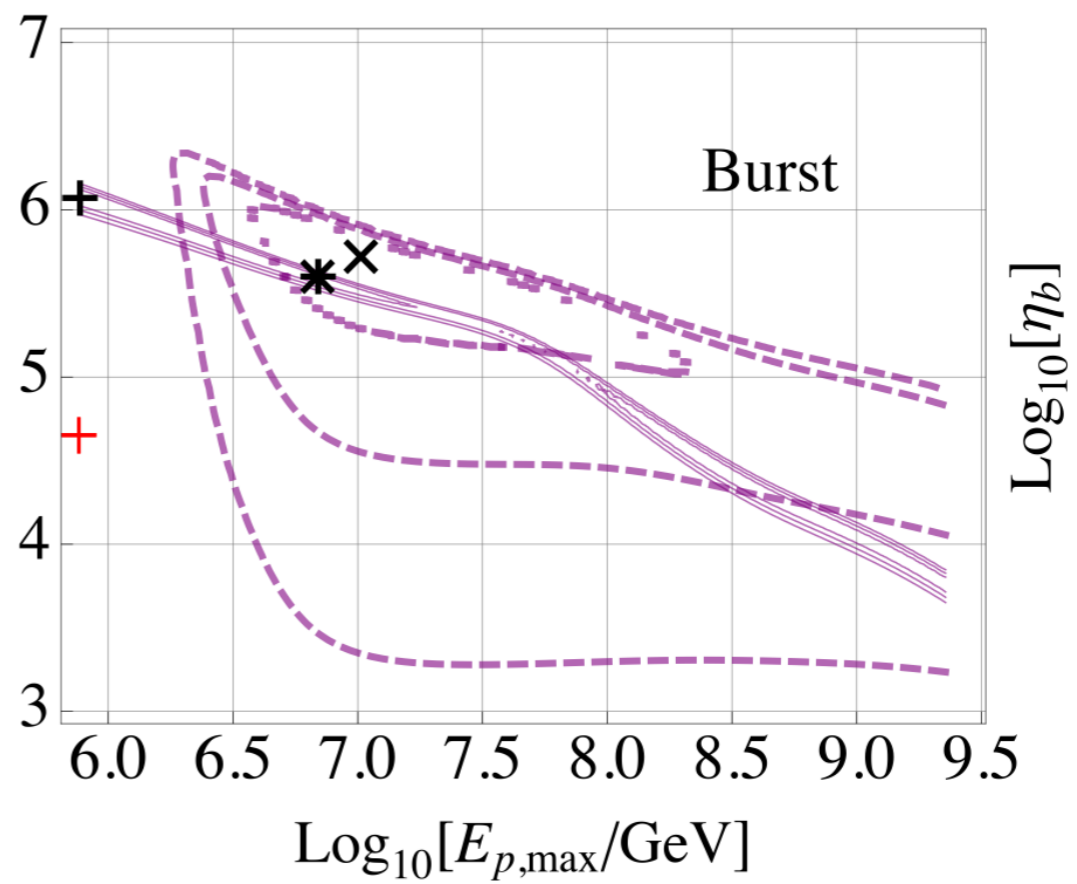

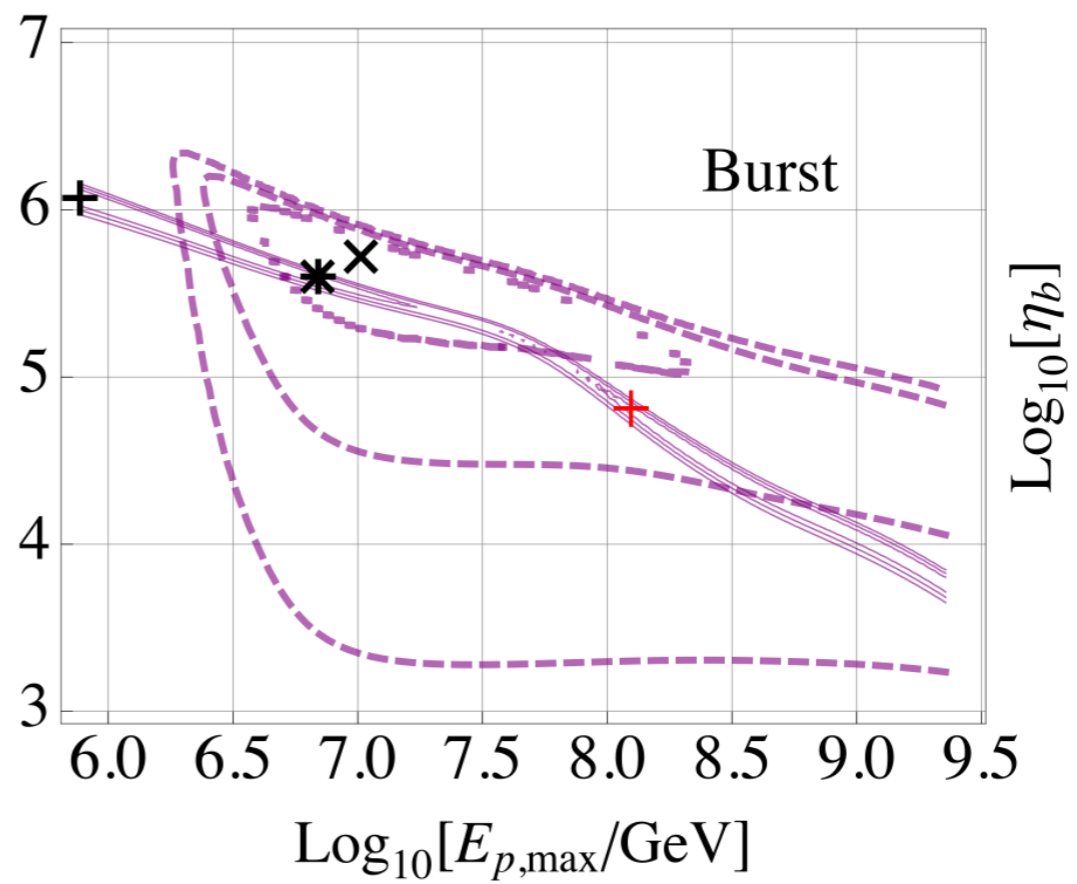

Other phases

Other phases

SED best-fit: Leptonic SSC

Question of how many protons it can tolerate.

ν best fit in tension with SED

IC 40 + 59 strings

No neutrinos

SED best fit consistent with this

Conclusions

- Caution: $L_\gamma \sim L_\nu$ OK for $LH\pi$; Invalid for LHs or $LH-SSC$ models — additional correction factor from theory.
- Degeneracy is large; ν + more MWL observation breaks it significantly.
- PKS B1424-418: able to reproduce “big-bird” event ($P \sim 5\%$) during both burst & IC-3yr phase.

- backup

Pure Hadronic Model

$$E_\nu \approx 0.05 E_p$$

$$\gamma'_p = 5 \times 10^6 \Gamma_{10}^{-1} E_{\nu, \text{PeV}}^{\text{ob}}$$

$$h \nu'_{\text{pk1}} / m_e c^2 = (m_e / m_p) (B / B_{\text{crit}}) \gamma_p'^2$$

$$B = 7 \times 10^{-4} \left(\frac{\nu_{\text{pk1}}}{10^{14} \text{ Hz}} \right) \left(\frac{\Gamma}{10} \right) \left(\frac{E_\nu^{\text{ob}}}{\text{PeV}} \right)^{-2}$$

$$\gamma'_{e|\text{p}\gamma} m_e \approx 0.05 m_p \gamma'_p$$

$$h \nu'_{\text{pk2}} / m_e c^2 = (B / B_{\text{crit}}) \gamma'_{e|\text{p}\gamma}{}^{-2}$$

$$B = 3 \times 10^{-2} \left(\frac{\nu_{\text{pk2}}^{\text{ob}}}{10^{23} \text{ Hz}} \right) \left(\frac{\Gamma}{10} \right) \left(\frac{E_\nu^{\text{ob}}}{\text{PeV}} \right)^{-2}$$

NU E is ~5% of parent proton

Derived p Lorentz factor

Freq. of 1st peak by p-syn

Required B field

Secondary e+- E is ~5% of parent proton

2nd peak by synchrotron emission of secondaries

Required B field

Requires contradictory B field values >> **Pure Hadronic Model not viable**

Leptonic and LH-SSC model

$$\gamma^2 \nu_{\text{sy}} = \nu_{\text{IC}}$$

$$\gamma_{\text{KN}} h \nu'_{\text{sy}} = m_e c^2$$

Thomson to KN scattering transition

$$\frac{\gamma}{\gamma_{\text{KN}}} = 0.006 \left(\frac{\nu_{\text{sy}}}{10^{14} \text{ Hz}} \frac{\nu_{\text{IC}}}{10^{23} \text{ Hz}} \right)^{1/2} \left(\frac{\Gamma}{10} \right)^{-1} \quad \text{2nd peak by Th. , not KN}$$

Cutoff due to $E_{e,\text{max}}$, or absorption by EBL (not discussed)

$$l_* \equiv \left(\frac{L'}{R} \right) / \left(\frac{4 \pi m_e c^2}{\sigma_T} \right) \approx 0.03 \left(\frac{L_{\text{ob}}}{10^{-11} \text{ erg cm}^{-2} \text{ s}^{-1}} \right) \left(\frac{\Gamma}{10} \right)^{-4} \left(\frac{R}{10^{15} \text{ cm}} \right)^{-1} \quad \text{compactness for gamma-rays}$$

GeV - TeV γ can escape source

Leptonic and LH-SSC model

$$\gamma_e'^2 \approx \nu_{\text{sy}}' / \nu_{\text{IC}}'$$

Thomson scattering

$$h \nu_{\text{sy}}' = m_e c^2 (B' / B_{\text{crit}}) \gamma_e'^2$$

Synchrotron, ~ 1st peak

$$\nu' = \nu^{\text{ob}} (1 + z) / \Gamma$$

$$u'_{\text{ph}} = \left(\frac{d_{\text{pks}}}{R_{\text{blob}}} \right)^2 \left(\frac{1 + z}{\Gamma} \right)^2 \frac{\nu F_\nu}{c}$$

comoving phot density

$$Y_{\text{SSC}} \approx \frac{u'_{\text{ph}}}{u'_B} \approx \frac{L(\nu_{\text{sy}})}{L(\nu_{\text{IC}})}$$

Y_{SSC} related to relative heights of the two peaks of SED

$$X = 10^i X_i$$

$$R_{18} \Gamma_{10} \approx 1.4 \left(\frac{L(\nu_{\text{sy}})}{10^{-11} \text{ erg cm}^{-2} \text{ s}^{-1}} / Y_{\text{SSC}} \right)^{1/2} \left(\frac{\nu_{\text{sy}}^{\text{ob}}}{10^{14} \text{ Hz}} \right)^{-2} \left(\frac{\nu_{\text{IC}}}{10^{23} \text{ Hz}} \right)$$

Expressed in all observed quantities

Requires either large R or Γ values

Numerical Calculation

Diff-integral Equations

$$\frac{\partial n(E)}{\partial t} = -\frac{\partial}{\partial \ln E} \left[A(E) - B(E) \frac{\partial}{\partial \ln E} \right] n(E) - \alpha n(E) + \epsilon$$

Solving time-dependent coupled kinematic equations for e^- , e^+ , p , n , γ , ν

$$n(E) \equiv \frac{dN}{dV d \ln x} = x \frac{dN}{dV dE}$$

$$\alpha(E) = \sum_{IT} \int c \sigma_{IT} n_{IT}(E_1) dE_1$$

$$\epsilon(E) = \sum_{IT} \int R(E \leftarrow E_1) d n_{IT}(E_1)$$

Coefficients derived from physics

Numerical Scheme : Finite Difference

Chang & Cooper for E

Crank & Nicolson for t

Stability + Energy conservation + Positive spectrum (even when dt and dN/dE is large)

Approximation

Semi-analytical solution for VHE e quasi-steady states within a step Δt

>> reasonable Δt and high efficiency resolving the stiffness problem at VHE

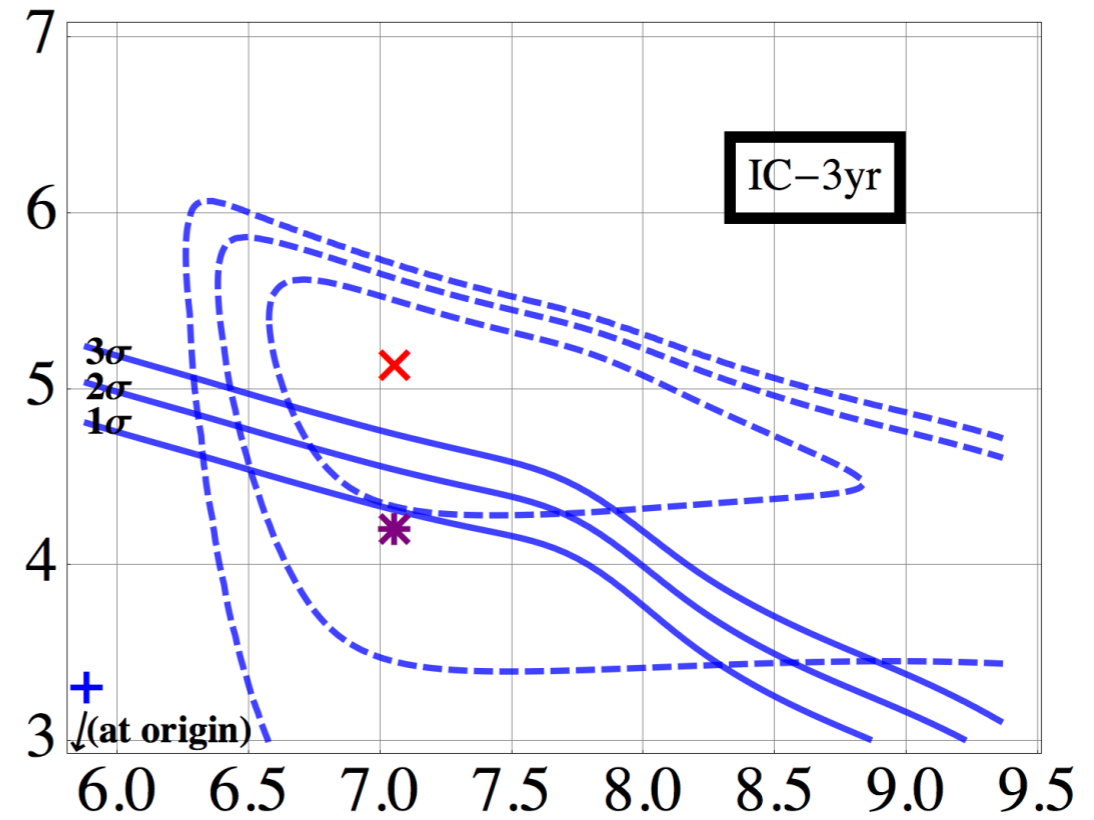

LH π model

- Allowed region : $F_{\text{psyn}} < \text{SED}$
- Allowed region : $Y_{\text{SSC}} < 1$ (otherwise SSC model)
- Allowed region : $F_{\text{BH}} < \text{SED}$
- Allowed region where $E_{\text{syn,VHE Lep}} \sim E_{\text{pk2,obs}}$

IC-3yr phase

SED best fit, a leptonic SSC-model

IC-3yr phase

SED - neutrino joint best-fit, $L_p/L_e \sim 10^4$

IC-3yr phase

neutrino best-fit, $L_p/L_e \sim 10^5$

IC-3yr phase

Max amount hadrons can a leptonic model tolerate

NU best-fit is in tension with SED best-fit (overshooting X-ray band)

Joint-fit gives $\sim 5\%$ probability to reproduce “big-bird” within this phase

3C 279, Steady-state, proton-synchrotron model

Mrk 421
