Computing Structure

Prerequisite

- Linear particle tracks
- $\gg 1024$ track segments accumulated to reach good performance

Andre Schmidt - KIT

Track Handling

- Photon count:
float64 vs float32
 $\frac{1}{\beta n} \sim \# \text{ Photon}$
 - β, n very close to 1
→ 0.03% difference in photon generation
- Mostly multiplications
and memory operations

Filter 1

- Angular cuts
- Dot product → Tensor possible

Filter 1

- Angular cuts
- Dot product $\rightarrow$ Tensor possible

Photon Generation

- Generate photons directions → vector
- Rotate and translate into particle system
Matrix multiplication

$$N_{\text{cher}} = 2\pi\alpha z^2 L \frac{\lambda_1 - \lambda_2}{\lambda_1 \cdot \lambda_2} \cdot (1 - (n\beta)^{-2})$$

- Rotate and Translate to Emission position

Photon Generation

Chromatic Dispersion

- Emission Wavelength dependent
- Edge cases:
 - Emission only part of specified wavelength possible

Filter 2

- Merged with fluorescence generation
- Not feasible for default Cherenkov propagation
 - Cuts cost more than simple propagation

Propagation

Propagation

Propagation

■ 2 Parameter: Height and Angle

Propagation

- Offset/Distance, Height, Angle
- Still possible to interpolate in hardware

Conclusion

- Cross-Check with Corsika 6.9, 7.4 and real Magic data started.
- Possible cooperation with Mathieu and LST possible
