# Singlet-Triplet Higgs Portal Dark Matter

**Anastasia Filimonova**

**Based on work with Susanne Westhoff, to appear**

Invisibles18 Workshop, KIT  
Karlsruhe — 6 September 2018

# Higgs portal for fermionic dark matter

$$\mathcal{L}_{int} \supset \frac{\lambda}{\Lambda} (\bar{\psi}_{DM} \psi_{DM}) (H^\dagger H)$$

# Higgs portal for fermionic dark matter

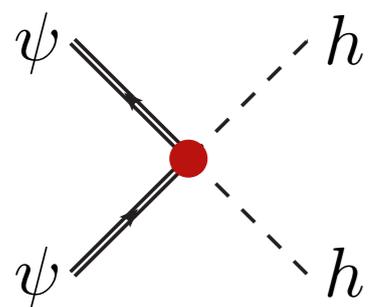

$$\mathcal{L}_{int} \supset \frac{\lambda}{\Lambda} (\bar{\psi}_{DM} \psi_{DM}) (H^\dagger H)$$

- $H^\dagger H$  is one of two lowest-dimensional gauge-invariant operators in SM.
- Provides WIMP candidate.
- Can be tested on current colliders.

# Higgs portal for fermionic dark matter

$$\mathcal{L}_{int} \supset \frac{\lambda}{\Lambda} (\bar{\psi}_{DM} \psi_{DM}) (H^\dagger H)$$

- $H^\dagger H$  is one of two lowest-dimensional gauge-invariant operators in SM.
- Provides WIMP candidate.
- Can be tested on current colliders.

Pure electroweak singlet, doublet, triplet.

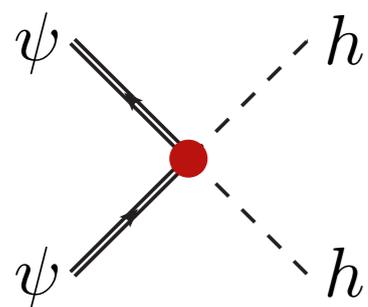

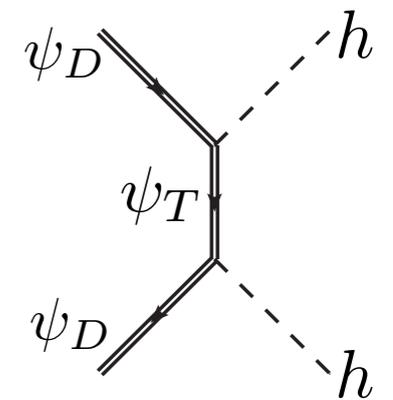

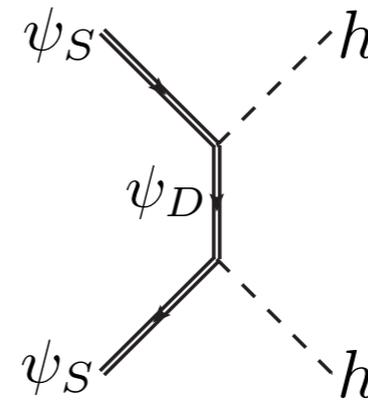

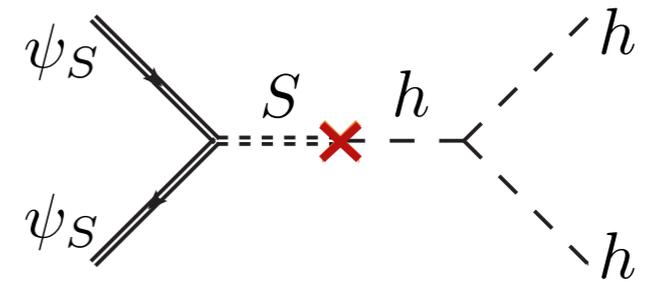

Dark matter candidate **only at Higgs threshold** or **too heavy for colliders.**

[Benival et al., 1512.06458] [Cirelli et al., 1507.05519]

# Singlet-triplet scenario

# Singlet-triplet scenario

---

2 majorana fields:  $SU(2)$  singlet  $\psi_S$  and triplet  $\psi_T$

$$\mathcal{L}_{\text{eff}} \supset -\frac{m_T}{2} \text{Tr}(\bar{\psi}_T \psi_T) - \frac{m_S}{2} \bar{\psi}_S \psi_S + \frac{\lambda}{\Lambda} \left[ (H^\dagger \bar{\psi}_T H) \psi_S + \bar{\psi}_S (H^\dagger \psi_T H) \right]$$

# Singlet-triplet scenario

---

2 majorana fields:  $SU(2)$  singlet  $\psi_S$  and triplet  $\psi_T$  **Naturally small**

$$\mathcal{L}_{\text{eff}} \supset -\frac{m_T}{2} \text{Tr}(\bar{\psi}_T \psi_T) - \frac{m_S}{2} \bar{\psi}_S \psi_S + \frac{\lambda}{\Lambda} \left[ (H^\dagger \bar{\psi}_T H) \psi_S + \bar{\psi}_S (H^\dagger \psi_T H) \right]$$

# Singlet-triplet scenario

2 majorana fields:  $SU(2)$  singlet  $\psi_S$  and triplet  $\psi_T$  **Naturally small**

$$\mathcal{L}_{\text{eff}} \supset -\frac{m_T}{2} \text{Tr}(\bar{\psi}_T \psi_T) - \frac{m_S}{2} \bar{\psi}_S \psi_S + \frac{\lambda}{\Lambda} \left[ (H^\dagger \bar{\psi}_T H) \psi_S + \bar{\psi}_S (H^\dagger \psi_T H) \right]$$

Mass states are admixtures of  $\psi_S$  and  $\psi_T$

Mixing angle:

$$\theta \simeq \frac{\mu}{m_T - m_S}$$

$$\mu = \lambda v^2 / \sqrt{2} \Lambda$$

Spectrum (tree-level structure):

$$m_T - m_S \begin{pmatrix} \psi_h \\ \psi_+ \\ \psi_l \end{pmatrix} \frac{\mu^2}{m_T - m_S}$$

# Couplings of dark fermions

# Couplings of dark fermions

---

Two physical scenarios, depending on parameters of the theory:

**Scalar case:**

Couplings  $\propto 1, \gamma_\mu$

**Pseudo-scalar case:**

Couplings  $\propto \gamma_5, \gamma_\mu \gamma_5$

# Couplings of dark fermions

Two physical scenarios, depending on parameters of the theory:

**Scalar case:**

Couplings  $\propto 1, \gamma_\mu$

**Pseudo-scalar case:**

Couplings  $\propto \gamma_5, \gamma_\mu \gamma_5$

Connected through  
chiral rotation:

$$\psi_l \rightarrow i\gamma_5 \psi_l$$

- Changes the sign of the mass term:

$$-m_l \bar{\psi}_l \psi_l \rightarrow m_l \bar{\psi}_l \psi_l$$

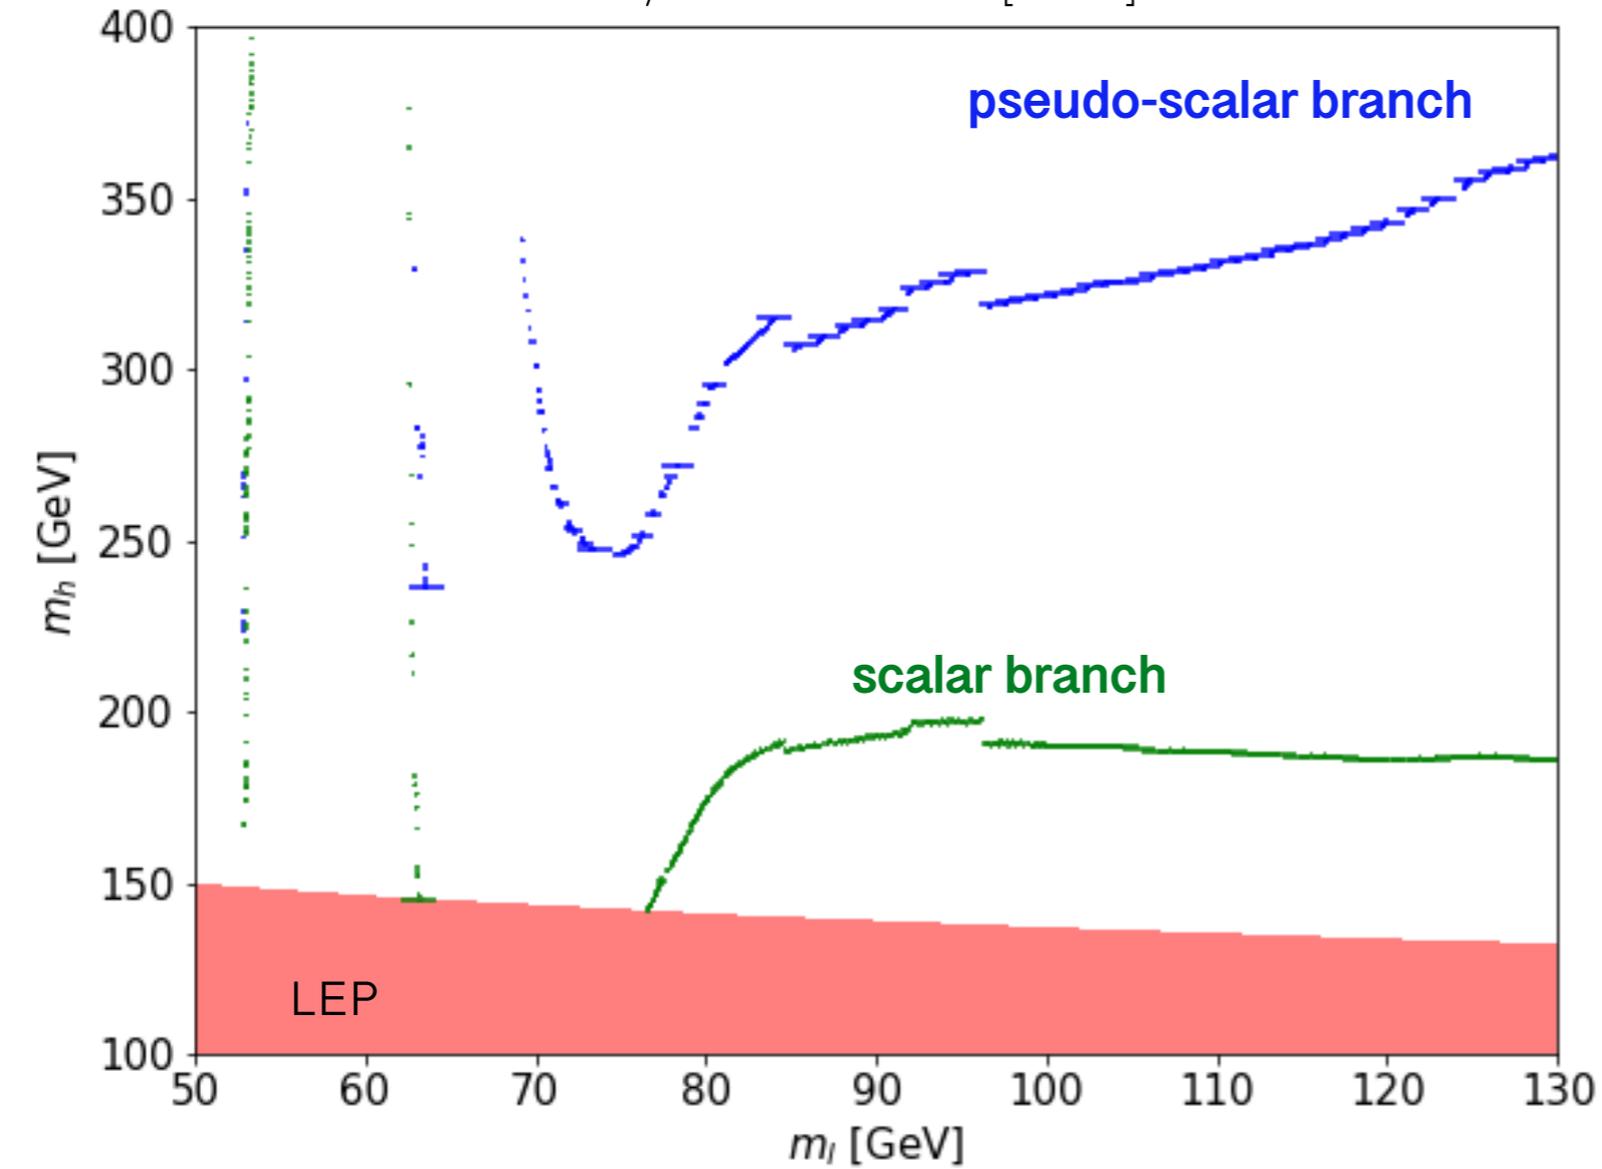

- Leads to pseudo-scalar (axial-vector) interactions:

$$\bar{\psi}_h \gamma_\mu \psi_l \rightarrow i \bar{\psi}_h \gamma_\mu \gamma_5 \psi_l$$

# Summary

- Singlet-triplet Higgs portal is a minimal fermionic extension to the SM weak sector with a naturally small coupling.
- There are two physical scenarios in this model: with scalar (vector) and pseudoscalar (axial-vector) couplings to Higgs (W bosons).
- The most promising collider signatures involve displaced particles. They probe very small portal couplings.
- New searches are needed to conclusively test this scenario: displaced jets and soft leptons, appearing tracks, etc.
