

Topic 5: high throughput and correlated magnetic resonance for increased information density

Vlad Badilita, Neil MacKinnon

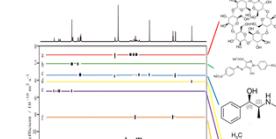

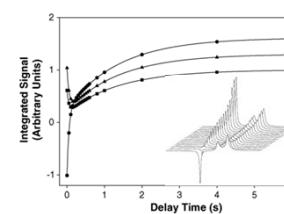

KIT – The Research University in the Helmholtz Association

www.kit.edu

Information provided by magnetic resonance

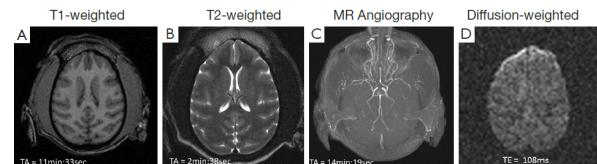

Spectroscopy

- Molecular structure
- Chemical exchange (intra-, intermolecular)
- Molecular transport (diffusion, flow)
- Physical parameters (pH, T, hydrophilicity, binding)

Imaging

- Spatial distribution of nuclear spin
- Contrast encoding based on physical parameters (density, T_1 , T_2 , diffusion, flow)

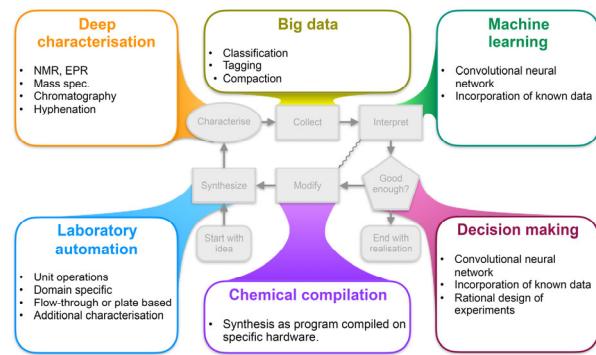

Imaging + spectroscopy: localized information

Xiaodong Zhang, et al., Quantitative Imaging in Medicine and Surgery 4 (2014) 112

HiT-NMR: high throughput screening

- Standard NMR measurements are done serially
- Measurement acceleration will be achieved by
 - Plug-flow based sampling approach
 - Parallelization of measurement sites
- Increased data volume will be used for machine-assisted sample preparation

Can we extract **more information?**

- **Other** morphological/micro-structural features?
 - porosity
 - cracks
 - sedimentation

CORREL lab @ IMT

X-ray imaging – beyond absorption

- **Three** information channels
 - absorption
 - phase contrast
 - diffraction

- high absorption-contrast materials
- internal borders – low absorption contrast
- scattering centres

Institute of Microstructure Technology 

CORREL lab @ IMT

Multimodal X-ray imaging for biological samples

- high absorption-contrast materials
- internal borders – low absorption contrast
- scattering centres

Institute of Microstructure Technology 

CORREL lab @ IMT

Time-resolved X-ray imaging

- In-situ monitoring of dynamic processes

- Transmission information
- Differential phase information
 - horizontal
 - vertical
