Introduction

Data life cycle

Victoria Tokareva, Andreas Haungs - Cosmic rays data center based on KCDC

Conclusion oo October 29, 2018 2/19

# Introduction: The astroparticle physics data rate

Modern astroparticle experiments data rate [Gbytes/day]\*

- More than hundred years of cosmic particle measurements;
- Looking at the same sky with different detectors;
- Common data rate for astrophysical experiments all together is a few PBytes/yeary, which is comparable to the current LHC output\*
- Big data for deep learning

### **KASCADE-Grande**

Karbruhe Institute of Technology

- Proposed in 1989—disassembled in 2013;
- Aimed at studying high-evergy (galactic) cosmic rays by observing extensive air showers (EAS);
- Consisted of:
  - scintillators detecting  $e, \gamma, \mu$ :
    - KASCADE—256 stations;
    - GRANDE—37 stations;
  - Hadronic callorimeter;
  - Digital radio array LOPES detecting *e*, *e*<sup>+</sup>;
- Important features of cosmic-ray spectrum have been obtained. The data analysis is ongoing;
- KCDC (KASCADE Cosmic Ray Data Center, http://kcdc.ikp.kit.edu) is a dedicated portal where all the data collected are available online.

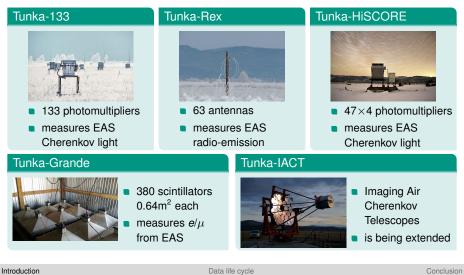

### TAIGA

0000

Started in the mid 90s, is still operating and continiously enhancend

Introduction	Data life cycle		Conclusion

# **Data-oriented approach**

#### What data do we work with?

- Data types:
  - Raw detector readouts;
  - Pre-analyzed events;
  - Metadata

Our approach:

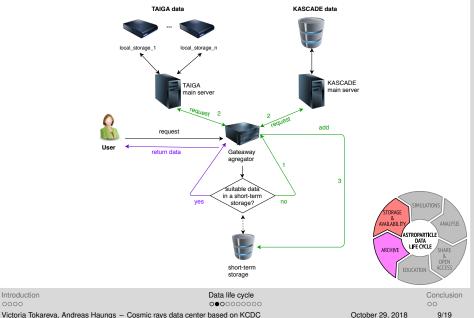

- Data structure:
  - Different formats;
  - Different messengers;
  - Common metadata
- It is proposed to store unique event id and metadata in the unified database
- With growing data sizes, distributed storage for events could be useful

#### Archiving and storage

## Simulation

#### Simulation: two steps

- Simulating EAS:
  - CORSIKA, does not depend on detector features, depends on location ans atmospheric conditions;
  - requires large computing power with a standard environment;
  - a small amount of input data and a large amount of output data;
- ② Simulating detector output:
  - depends on detector features;
  - requires dedicated software and special environment for it;
  - large amount of both input and output data;

#### Analysis

- Analysis could be either algorithmic or machine learning;
- Machine learning requires large enough statistics in order to work properly.

October 29, 2018 13/19

#### **Analysis features**

#### Software for data analysis depends on a particular experiment

- Problem: It may even require dedicated system environment
- Solution: Virtualization<sup>†</sup>

#### Data analysis requires huge amounts of input data

- Problem: It is often more optimal to perform it on the same site the data are stored
- Solution: Job management

<sup>†</sup> "The act of creating a virtual (rather than actual) version of something, including virtual computer hardware platforms, storage devices, and computer network resources". © Wikipedia

### WMS—workload management system

- The basic idea is to provide a central queue for all users and make all the distributed sites look like local ones:
- Starting from mid 90's are widely used in collider experiments (Dirac, PanDA);
- Dedicated for:
  - Unified usage of the distributed remote data and common data analysis:
  - Conceal various low-level software and provide unified high-level interface:

Data life cycle 0000000000

- Provide the common way to issue tasks to different types of the distibuted sites;
- The same system for the data access, analysis and simulation.

### Summary

- The KASCADE-Grande project has a data center called KCDC, that is planned to serve as the basis for the future common center for data access;
- The differences in the data formats were analyzed and solutions for organizing storage and distributed data processing were proposed;
- A scheme of a relational database for the future data center is designed using a metadata-based approach;
- The possibilities to apply the results of the project to educational and outreach activities are being explored.
- We are developing a new approach to the astroparticle data life cycle for combined analysis of the KASCADE-Grande and TAIGA data;
- The built-up infrastructure will be used to analyze combined data sets with large statistics, allowing to study galactic sources of high-energy γ-rays, which could be a notable step forward in multi-messenger astroparticle physics.
