1. The Quest for $\epsilon S \geq 90\%$: Motivation and Goals

Motivation and Goals

IDEA: Reduce background contamination using classical cut-based selection as a first step toward training a Transformer-based classifier.

Goals:

- Signal efficiency $\epsilon_S \geq 90\%$
- Background efficiency $\epsilon_B < 1\%$

Strategy:

- Accept $\epsilon_B < 5\%$ as an intermediate milestone
- Scan signal efficiency thresholds from 70% to 100%

2. Building the Selection: Variables, Cuts and Scan Strategy

Variables used for cut optimization

- EVT_ThrustEmin_E
- EVT_ThrustEmin_Eneutral
- EVT_ThrustEmin_Nneutral
- EVT_ThrustEmax_E
- recoEmiss_e
- EVT_NTau23Pi
- EVT_ThrustEmin_NDV
- EVT_NVertex
- mDiTau_Vis
- EVT_ThrustEmin_NTau23PiCand

Four variable configurations were tested, each using a different subset of the available discriminating variables (see Appendix)

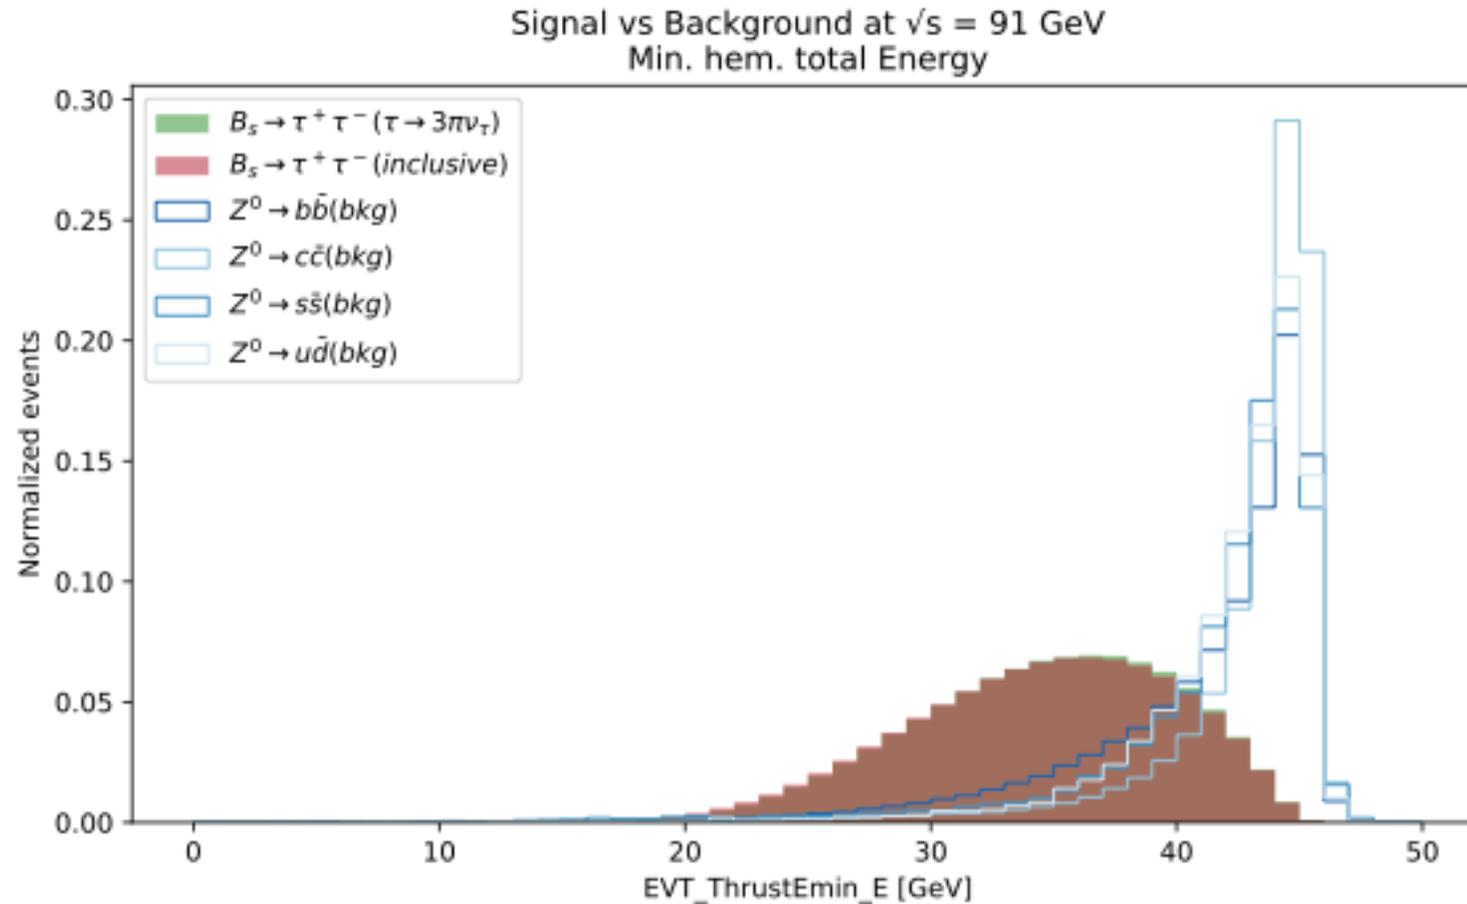

How was done the cut optimization?

1. Inspect signal and background distributions per variable
2. Define cut ranges where separation is most evident
3. Sample cut values uniformly within each range
4. Evaluate all possible cut combinations (combinatorial scan)

At least 10^5 combinations evaluated per configuration

5. Save combinations satisfying $\epsilon S \geq \text{target}$ AND $\epsilon B < 5\%$
6. Scan target signal efficiency from 100% down to 70%
7. Save the cut that **maximizes significance S/\sqrt{B}**

Example of possible range

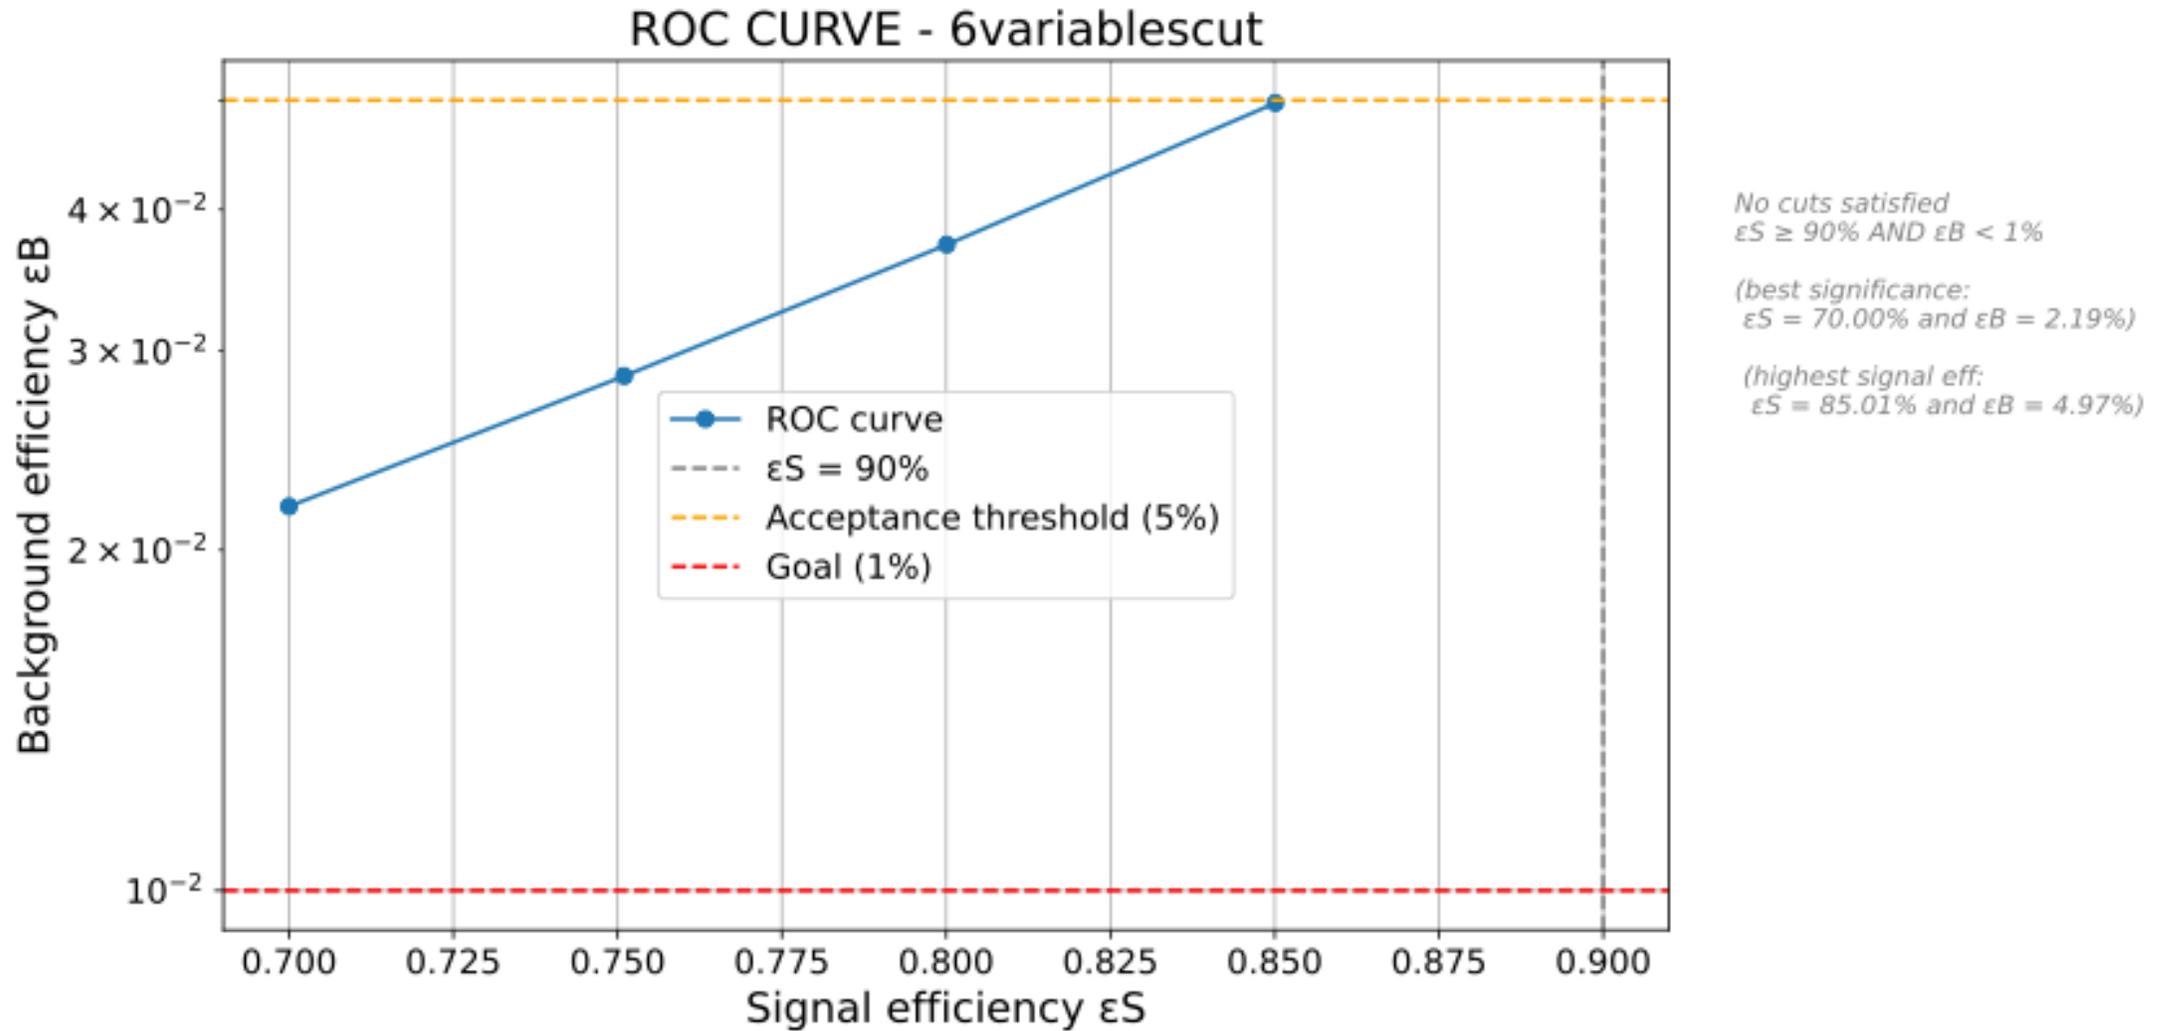

`EVT_ThrustEmin_E_range`
`= np.linspace(40, 47, 8)`

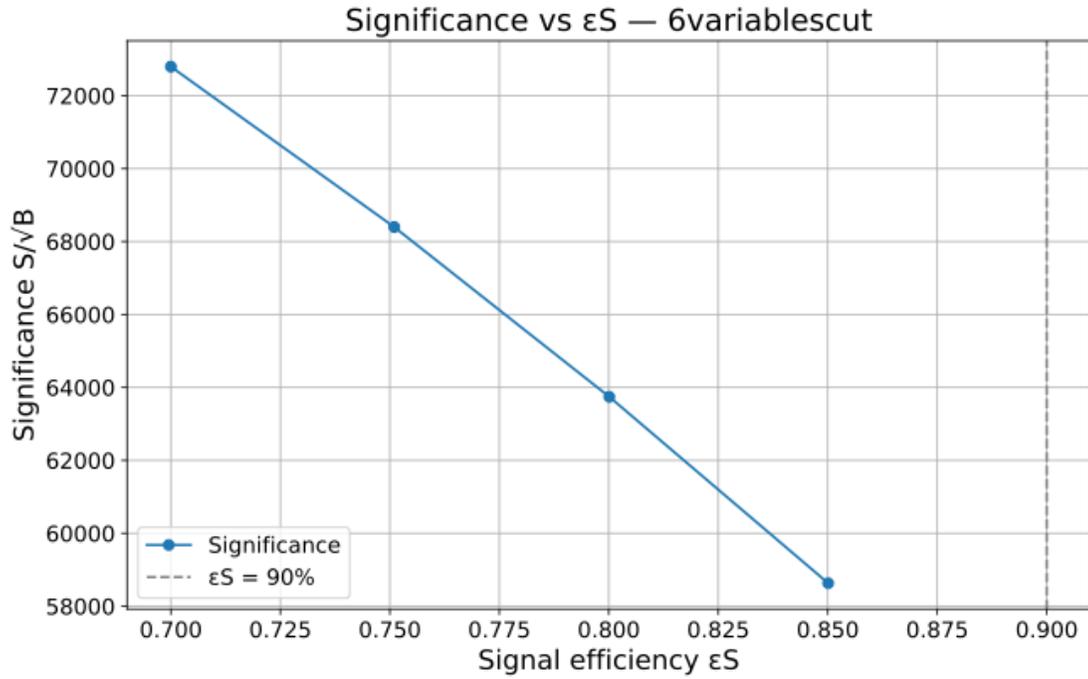

3. Did We Reach the Goal?

Results and Comparison

“6variables cut”-ROC Curve

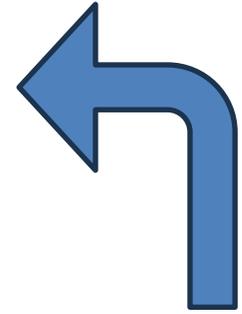

“6variables cut”-Significance plots

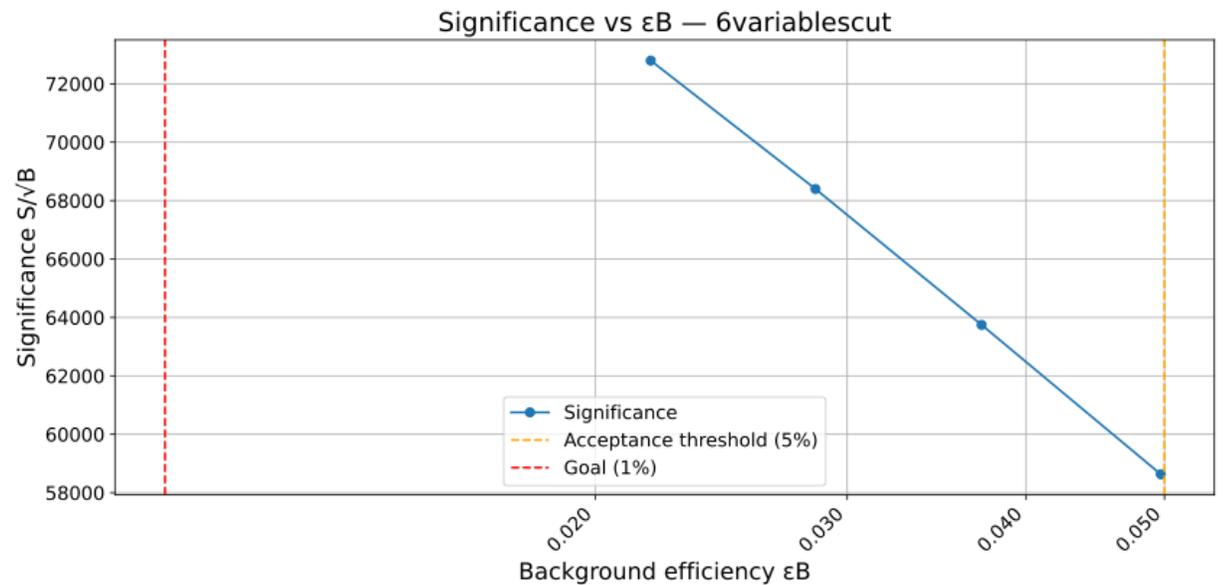

No cuts satisfied
 $\epsilon_S \geq 90\%$ AND $\epsilon_B < 1\%$
 (best significance:
 $\epsilon_S = 70.00\%$ and $\epsilon_B = 2.19\%$)
 (highest signal eff:
 $\epsilon_S = 85.01\%$ and $\epsilon_B = 4.97\%$)

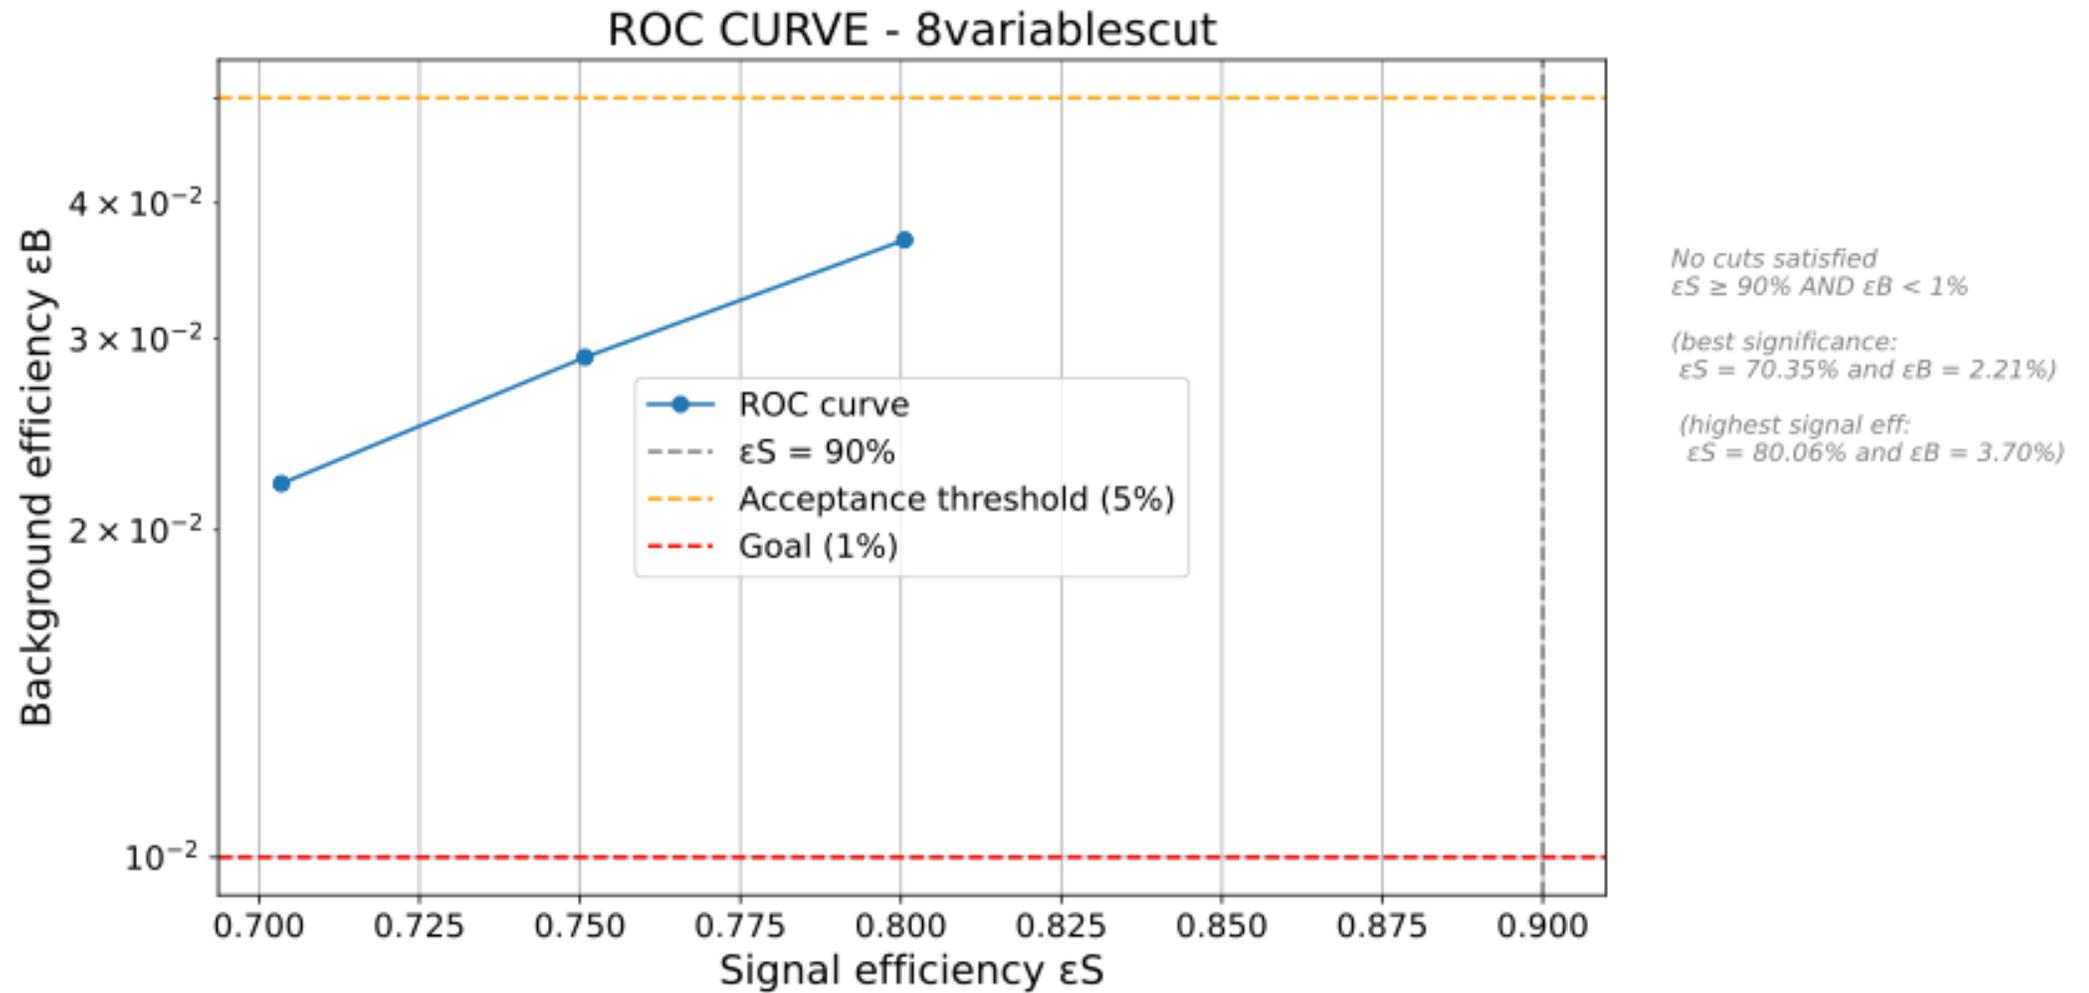

Significance vs
 Bkg efficiency

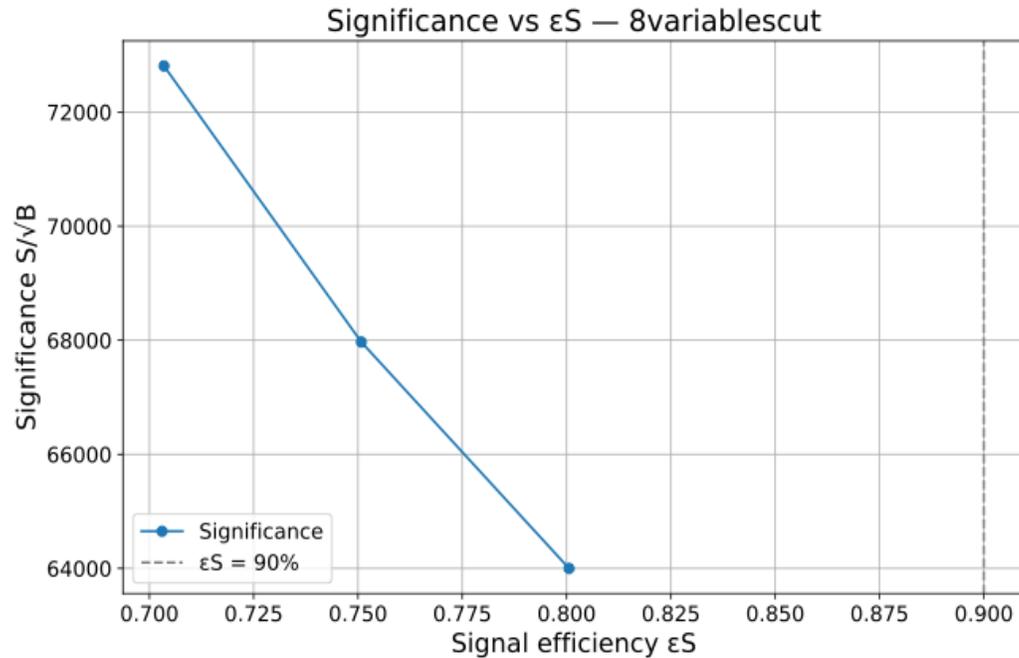

Significance vs
 Signal efficiency

“8variables cut”-ROC Curve

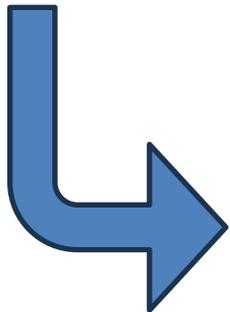

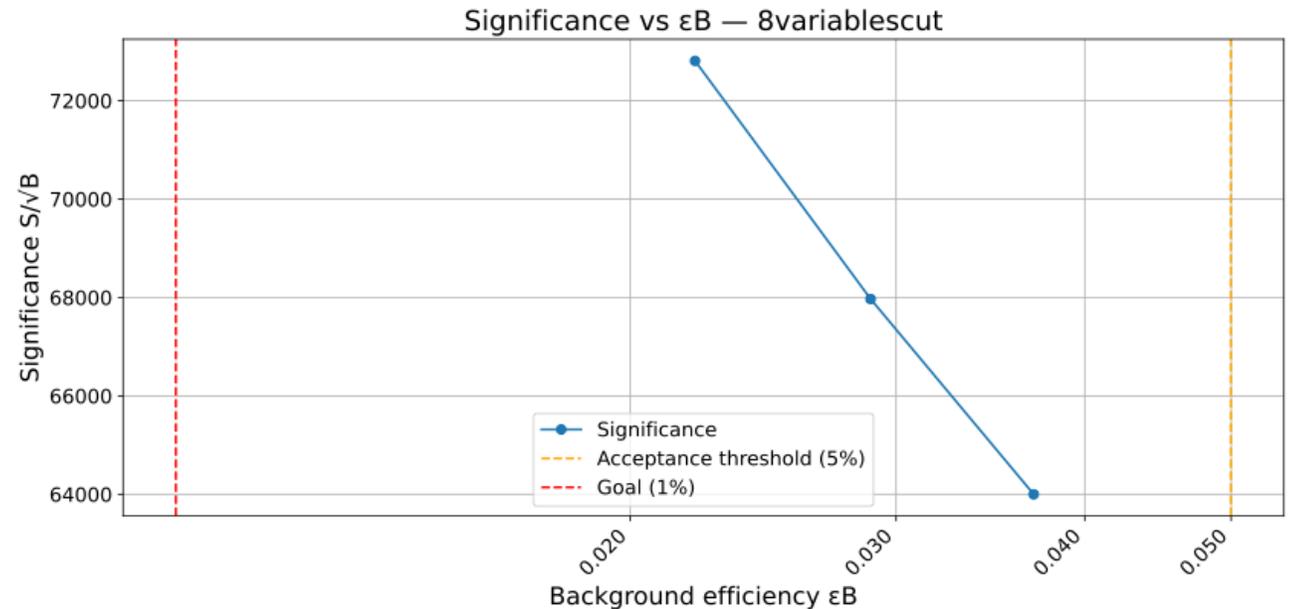

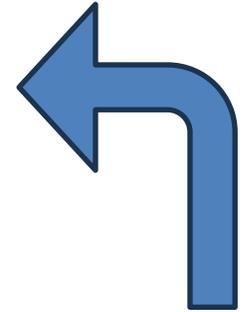

“8variables cut”-Significance plots

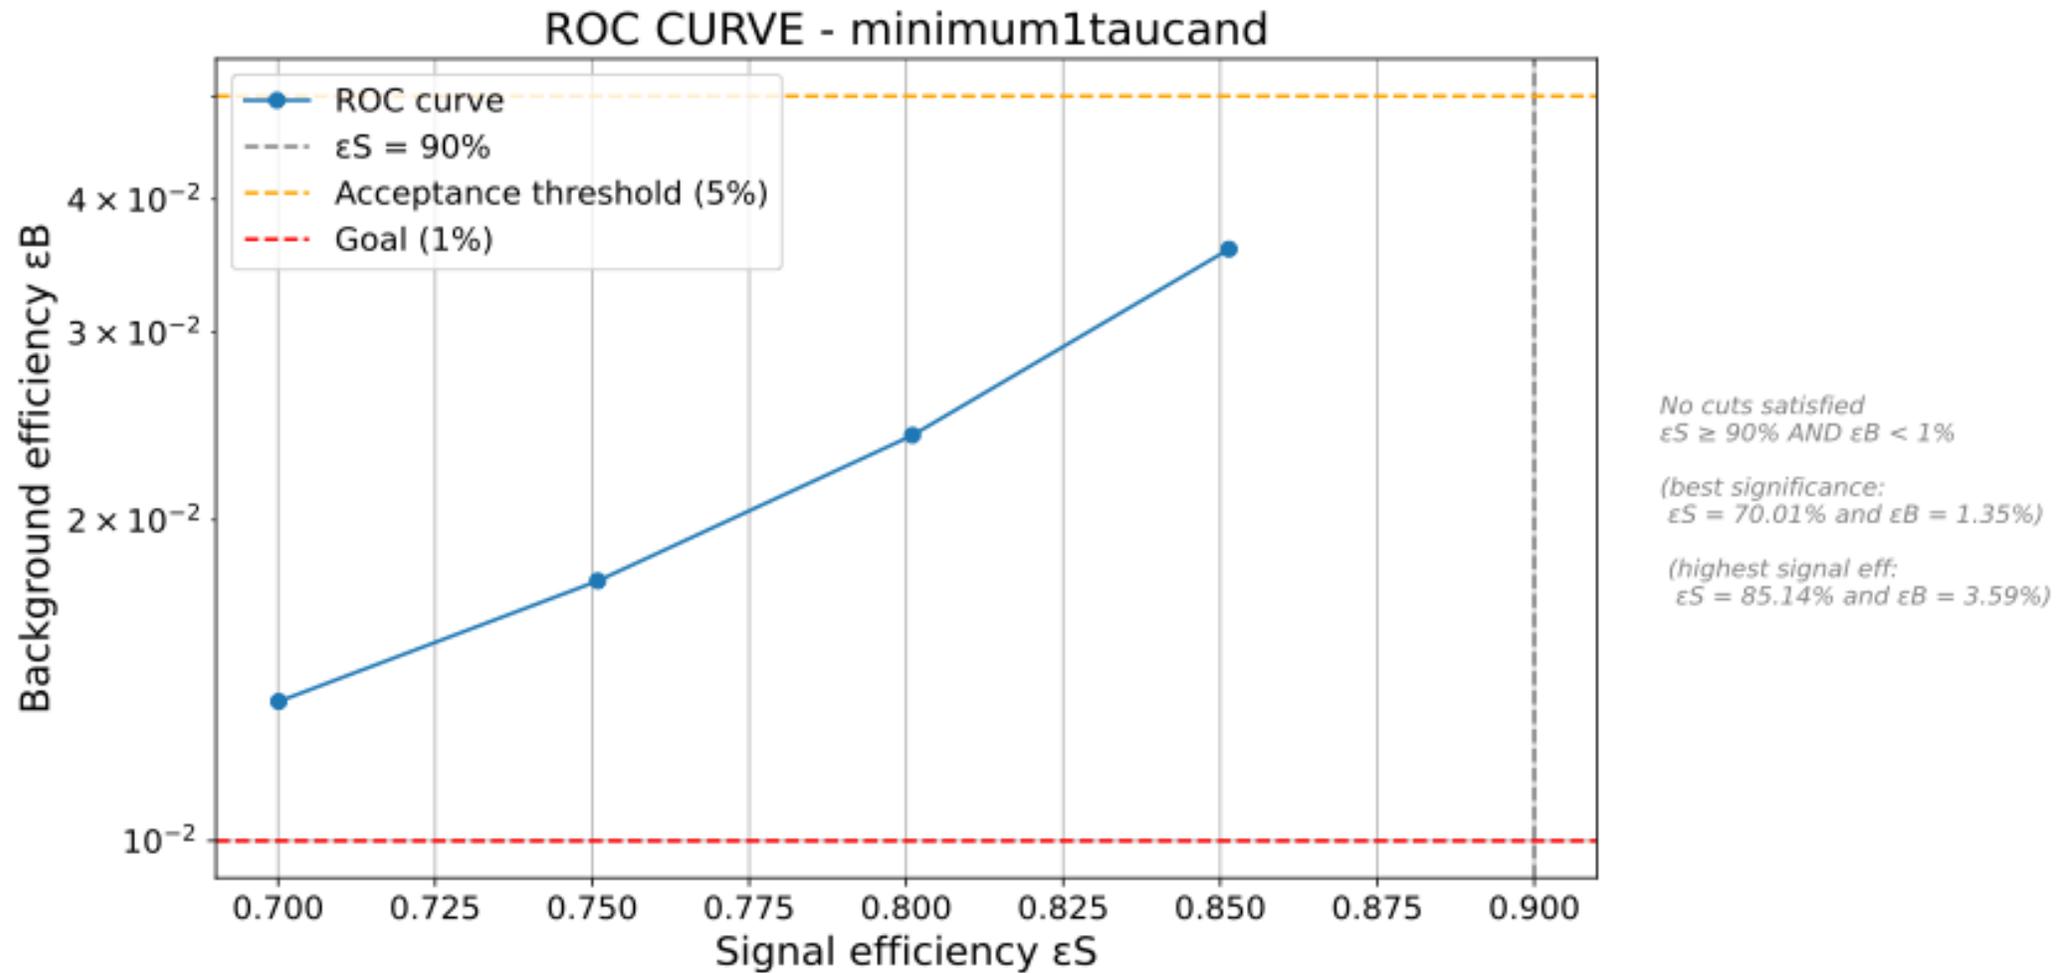

No cuts satisfied
 $\epsilon_S \geq 90\%$ AND $\epsilon_B < 1\%$
(best significance:
 $\epsilon_S = 70.35\%$ and $\epsilon_B = 2.21\%$)
(highest signal eff:
 $\epsilon_S = 80.06\%$ and $\epsilon_B = 3.70\%$)

Significance vs Bkg efficiency

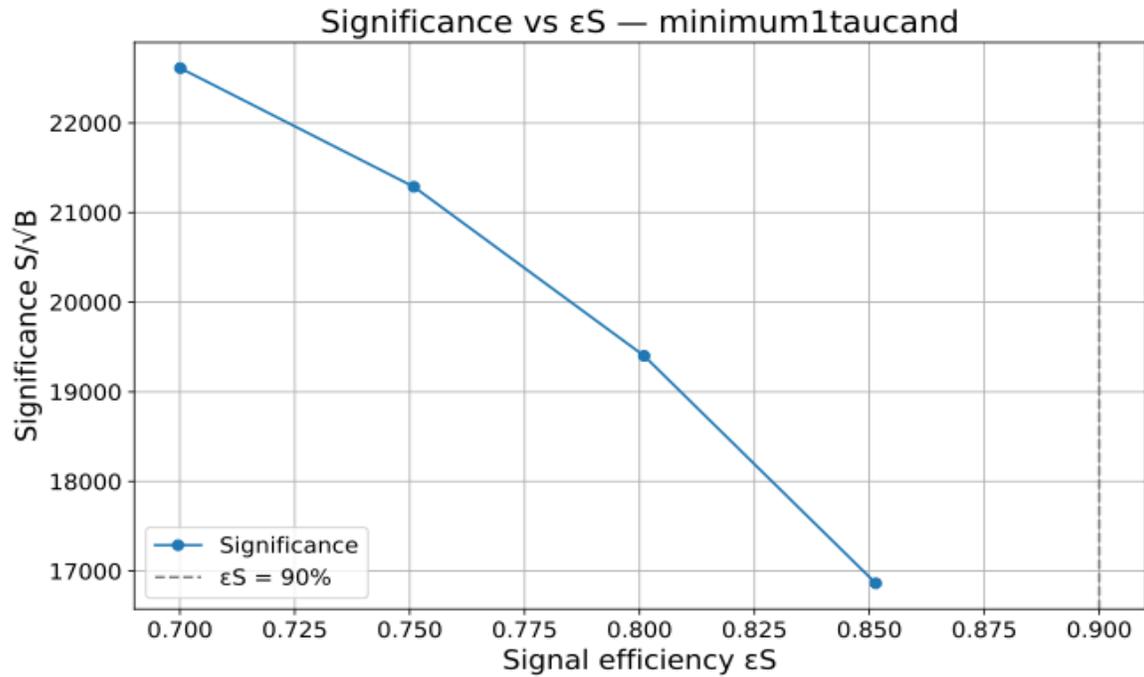

Significance vs Signal efficiency

“minimum1TauCand”-ROC Curve

“minimum1TauCand”-Significance plots

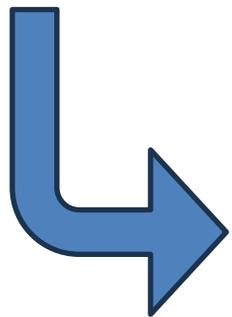

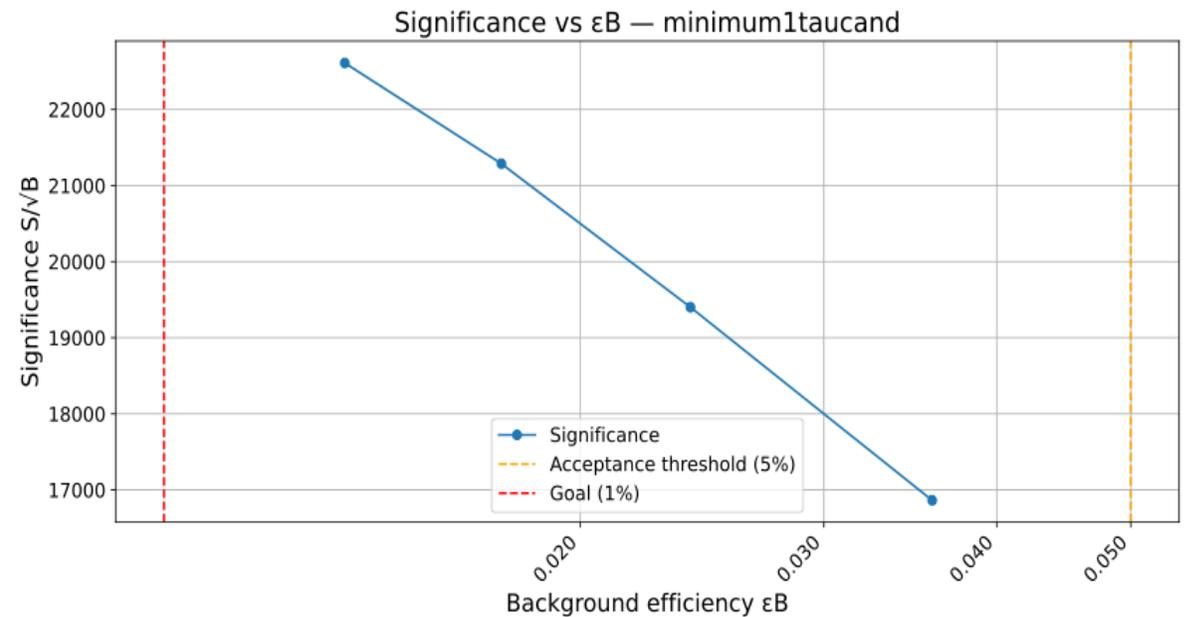

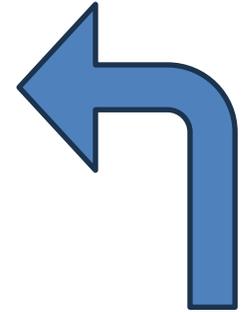

No cuts satisfied
 $\epsilon_S \geq 90\%$ AND $\epsilon_B < 1\%$

(best significance:
 $\epsilon_S = 70.01\%$ and $\epsilon_B = 1.35\%$)

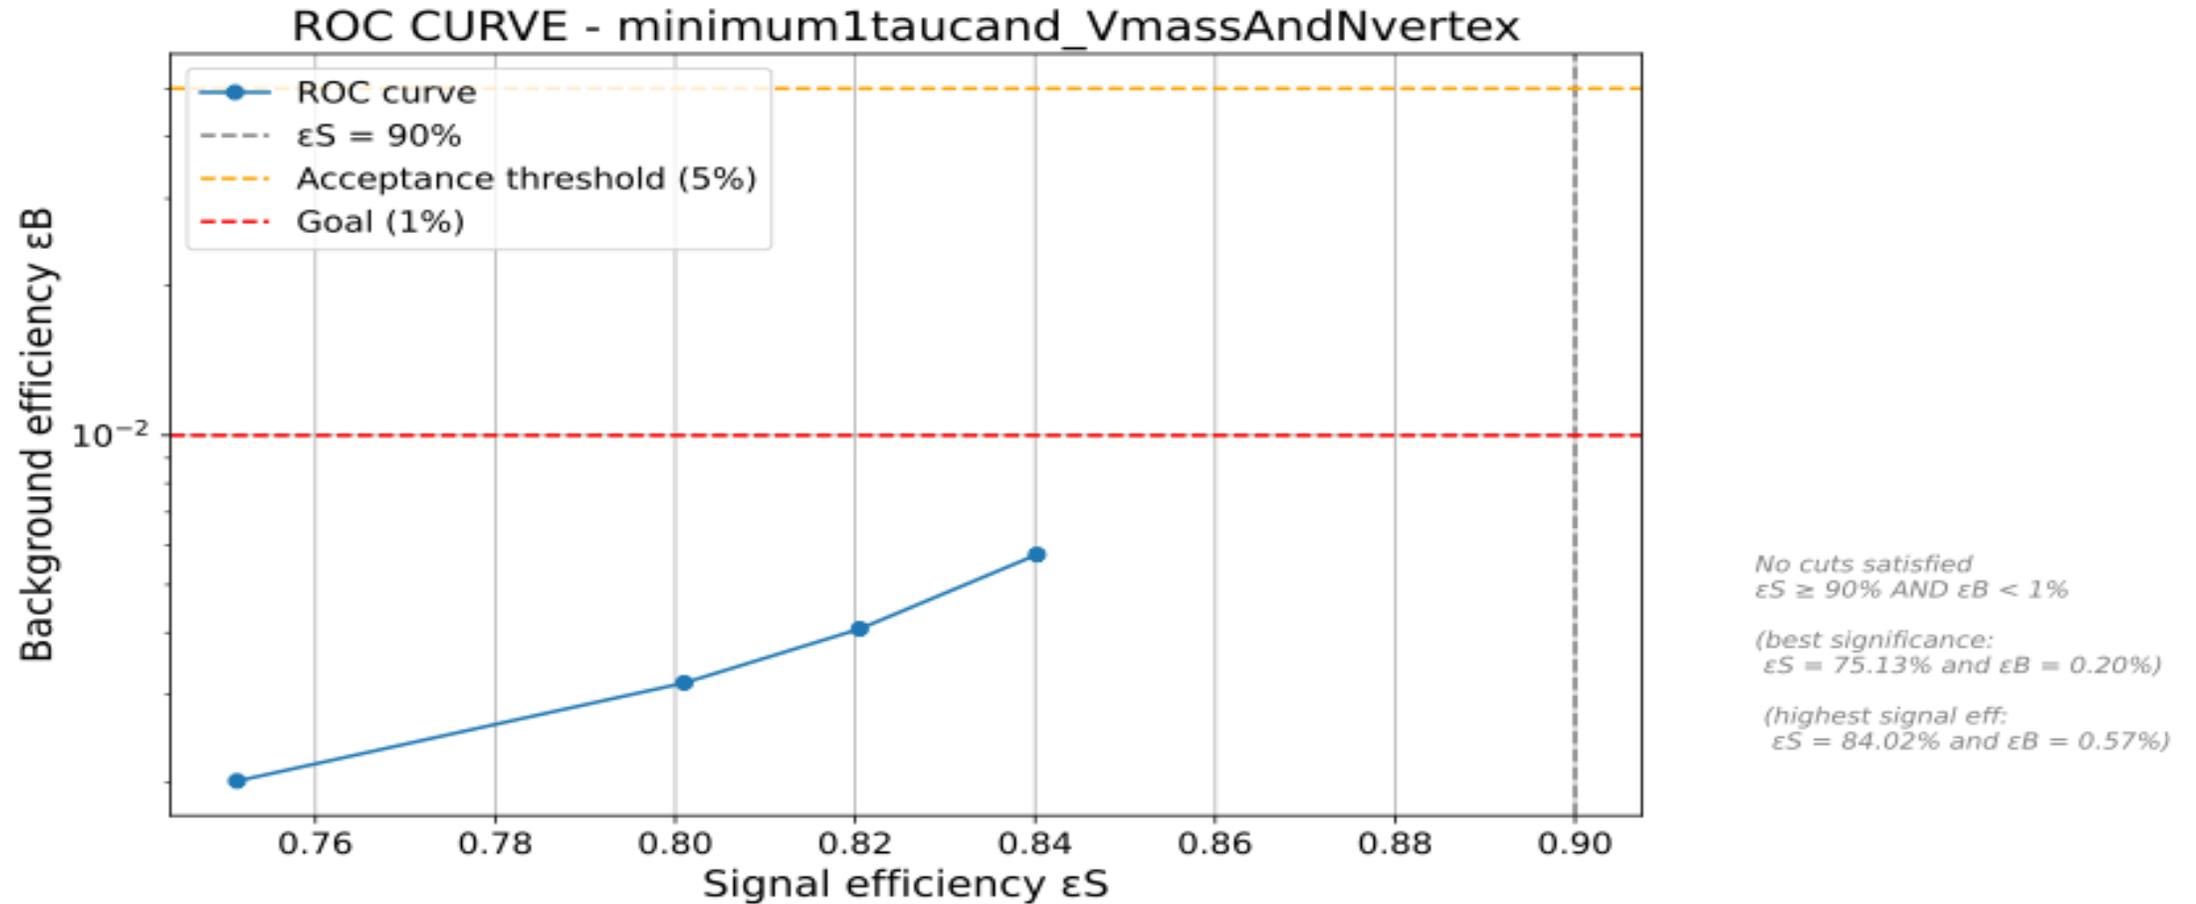

(highest signal eff:
 $\epsilon_S = 85.14\%$ and $\epsilon_B = 3.59\%$)

Significance vs
 Bkg efficiency

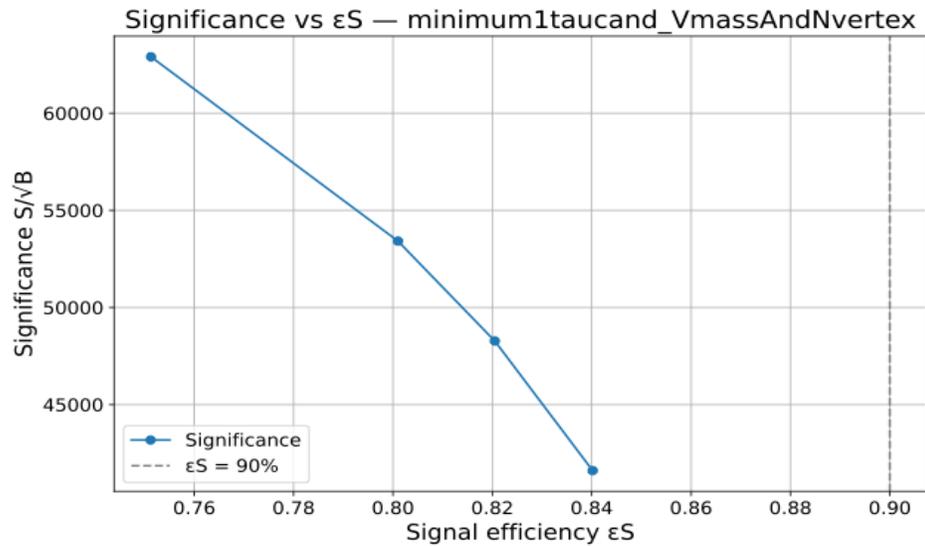

Significance vs
 Signal efficiency

“minimum1TauCand_VmassAndNVertex”- ROC Curve

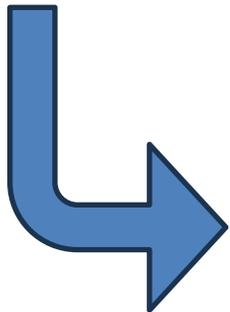

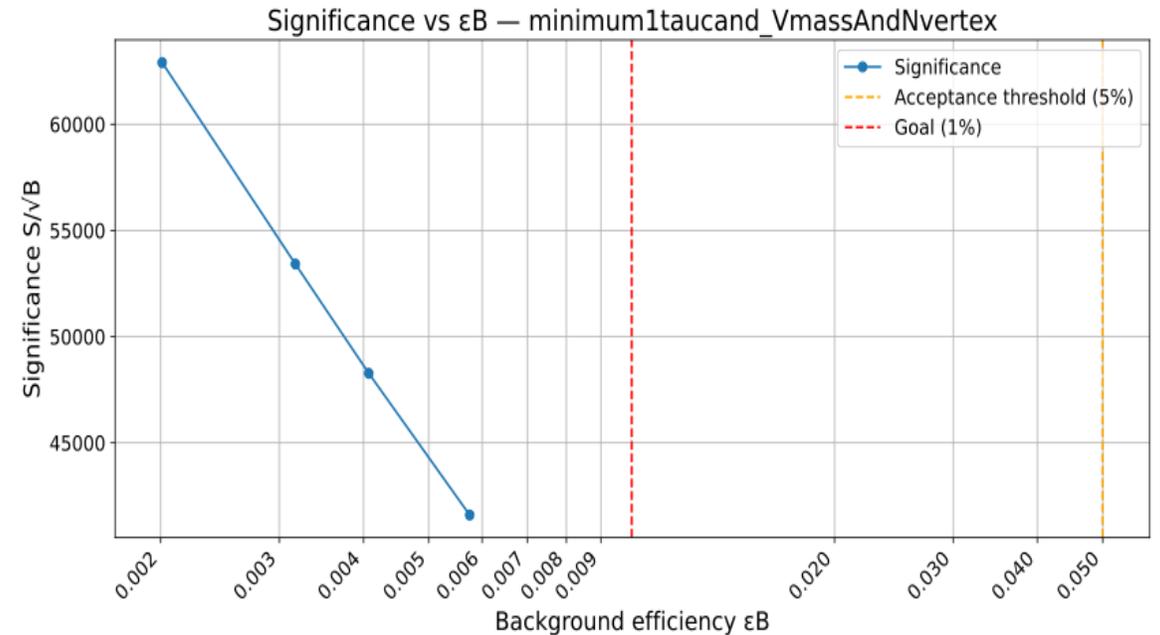

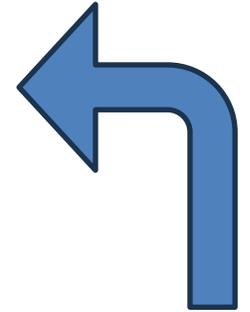

“minimum1TauCand_VmassAndNVertex”- Significance plots

No cuts satisfied
 $\epsilon_S \geq 90\%$ AND $\epsilon_B < 1\%$
 (best significance:
 $\epsilon_S = 75.13\%$ and $\epsilon_B = 0.20\%$)
 (highest signal eff:
 $\epsilon_S = 84.02\%$ and $\epsilon_B = 0.57\%$)

Significance vs
Bkg efficiency

Significance vs
Signal efficiency

Best cuts found from “minimum1TauCand_VmassAndNVertex”

- $\text{EVT_ThrustEmin_E} < 47.00 \text{ GeV}$
- $\text{EVT_ThrustEmin_Eneutral} < 13.00 \text{ GeV}$
- $\text{EVT_ThrustEmin_Nneutral} < 23.00$
- $\text{EVT_ThrustEmax_E} < 55.00 \text{ GeV}$
- $\text{recoEmiss_e} > 2.00 \text{ GeV}$
- $\text{EVT_NTau23Pi} > 1.00$
- $\text{EVT_ThrustEmin_NDV} > 1.00$
- $\text{EVT_Nvertex} > 1.00$
- $\text{mDiTau_Vis} > 2.00$
- $\text{EVT_ThrustEmin_NTau23PiCand} > 1.00$

$\epsilon_S = 84.02\%$

$\epsilon_B = 0.57\%$

$S/\sqrt{B}: 41600$

Summary + Practical Next Steps

Status:

- The goal of $\epsilon_S \geq 90\%$ AND $\epsilon_B < 1\%$ was not achieved in any configuration
- Best results obtained $\epsilon_S = 84.02\%$; $\epsilon_B = 0.57\%$
from (minimum1TauCand_VmassAndNVertex)
- This represents a promising baseline for further optimization

Next Steps:

- Apply the best cut configuration as a preselection
- Train a Transformer-based classifier on the preselected sample
- Evaluate additional background rejection with respect to this baseline

**Thank you for
your attention!**
